  Most existing single hull crude oil carriers only use heating coils in the slop tanks which usually do not have ballast tanks as boundaries. White oil product carriers do not need heating and therefore they should not be included in additional annual survey requirements for ballast tanks. Majority of GPG Members agreed.

Submitted by the Permsec
On 18 Sept 2000

Technical Background Document
WP/SRC Task 77
UR Z7 – Proposed Draft Revision 7
(Including Rev.8 of Z10.1, Rev.11 of Z10.2, Rev.4 of Z10.3)

Objective and Scope:

Extend the requirements for permanent repairs at the time of survey in UR Z 10.2 to all ships.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC members through correspondence and discussions at the September 2000 meeting.

Points of Discussion:

UR Z7 was amended to apply "prompt and thorough" repairs to all vessels. The new wording defines a prompt and thorough repair to be a repair as a result of wastage and not an incident such as contact damage where a temporary repair or deferral of repairs could be permitted. This wording is more explicit than the wording in UR Z10.2 and should achieve a uniform application among the Members.

WP/SRC also agreed to include these requirements in Z10.1, Z10.2 and Z10.3 in order to not effect A.744(18).

WP/SRC unanimously agreed to the draft UR.

Note by Permsec

GPG 49 (11-13 Oct. 2000) agreed that the same changes be introduced to Z10's and carried out editorial review of Z 10's.

Technical Background Document
WP/SRC Task 75
UR Z10.1 – Proposed Draft Revision 8
&
Z10.3 – revision 4

Objective and Scope:

Develop a definition of 'related piping' as contained in UR Z10.1 and requirements for survey.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC members through correspondence.

Points of Discussion:

The proposal limits the definition of "related piping" to the piping systems which require testing. This will not include hydraulic oil piping for remote control valves or anchor/mooring equipment which OCIMF may have wanted included. WP/SRC feels that related piping systems are those that are unique to an oil carrier and was the original intent of the wording.

WP/SRC unanimously agreed to the draft UR.

Note by the Permsec:

LR GPG proposed to change Z10.1 as follows:

> "piping systems for the handling of cargo / cargo residues and water ballast and additionally bilge systems in combination carriers. 8220iLRa, 30/8/2000"

GPG Chairman asked WP/SRC to discuss LR's proposal to include "bilge piping systems" in Z10.1 at their 2000 September meeting.

WP/SRC Chairman reported back to GPG on 22 September 2000 as follows:

> 1. "Cargo piping" adequately covers and is understood by all members to include cargo stripping piping, just as "Ballast piping" includes ballast stripping piping.
>
> 2. WP/SRC is of the opinion that bilge piping on combination carriers should not be added to the proposed revision due to the fact that it is a separate system which usually run through a pipe tunnel and is not hydro tested at new construction. The system also operates on a vacuum and is blanked off when oil is carried.
>
> Therefore, WP/SRC maintains its agreement that the previously submitted text is the preferred by all members.

GPG agreed that a similar amendment be made to Z10.3.

Based on the above discussion at GPG level, the revised of Z10.1 and Z10.3 was finally approved at GPG 49.

Submitted by WP/SRC Chairman

On 27 July 2000

(This view was shared by the majority of GPG Members, however, it has not been codified in Z 10.1 because no need was identified to prescribe it as a Unified Requirement.)

- Identify tanks with heating coils

  WP/SRC Chair said that the vessel's survey status does not tell us tanks fitted with heating coils.

- Coating Condition and Substantial Corrosion Survey Requiremnets

  Ballast tanks with poor coating, no coating or substantial corrosion identified at a previous survey already requires annual survey. With enhanced intermediate survey, all ballast/cargo tanks will be examined and gauged at special/intermediate survey and coating condition & substantial corrosion should be identified at that time. If coating condition is reported good or fair, it may be adequate to only verify the coating condition at annual survey of ballast tanks adjacent to cargo tanks fitted with heating coils.

In addition, DNV and LR (GPG) proposed the following additions:

- The 3rd sentence in para. 3.2.5.2 (DNV):

  "Tanks or areas where coating was found to be in GOOD condition at the previous intermediate or special ~~internal examination are to~~ survey may (ABS' comment) be specially considered by the Classification Society."

  The majority GPG agreed.

- The second half of the para. 4.2.4.1(LR)

  "except that testing of cargo and ballast tanks is not required unless deemed necessary by the attending surveyor."

  The majority GPG agreed.

- The paragraph 7.1.1 of Z10.1 and Z10.3, paragraph 8.1.1 of Z10.2 were revised for their compatibility with the PR 19 "PR for Thickness Measurement".

Technical Background for

Rev.8.1, Z10.1

Rev.11.1, Z10.2

Rev.4.1, Z10.3

(21 June 2001)

1. Scope of objectives

Revise section 2.3.1 for clarity.

2. Points of discussions or possible discussions

- BV GPG member proposed to revise section 2.3.1 of Z10s on 12 June 2001 (0065j)

- IACS Council considered the ambiguity of the sentence in Special Survey section 2.3.1 “For Fuel Oil Tanks the necessity for the Overall Survey is to be determined based on the ship’s age” in the context of its application at intermediate surveys on ships over 15 years. Council agreed that the overall survey of low corrosion risk tanks such as fuel oil, lube oil and fresh water tanks could be subject to special consideration as already addressed in section 2.2.5 of UR Z7 and therefore amended the first sentence of 2.3.1, accordingly, and deleted the last sentence of 2.3.1.

- Adopted on 21 June 2001.

* * * * *

Technical Background Document
WP/SRC Task 87
Amend Z10.1&10.2 to reflect changes introduced to Res A.744 by MSC 73
(Z10.1, Rev.9) + (Z10.2, Rev.12) + (Z10.3, Rev.5)

Objective and Scope:

To harmonise IACS UR Z10.1 and Z10.2 with IMO Res A744(18), as previously amended and as amended by IMO MSC105(73) and MSC 108(73).
These amendments enter into force 1 July 2002.
It was assumed by WP/SRC that the intention of GPG has been to revise UR Z10.3 (chemical tankers) as well with respect to the intermediate dry-docking requirement, but not to include the requirement to evaluation of longitudinal strength.
In addition, the relevant changes to UR Z10.1 based on the changes introduced in IMO Res A744(18) as reported in MSC 74/24/Add1-Annex 17 have been included. These were based on IACS submission DE 44/13/1. These amendments will enter into force 1 January 2004 subject to IMO tacit acceptance procedures.

POINTS OF DISCUSSION:

The Chairman of WP/SRC would further draw GPG's attention to paragraph 4.2.4.3, which contains the requirement to intermediate dry-docking for oil tankers exceeding 15 years of age. The corresponding Res.A 744(18) requirement (paragraph 2.2.2) does not link the dry-docking to the intermediate survey. This issue was discussed extensively by correspondence and during three WP meetings this year. A consensus decision was achieved without reservations from any members. This process was time consuming, hence the delay in submitting this document to GPG for approval. However, at the annual meeting of the WP in October 2001 all members agreed that we should not accept the wording of Res. A 744(18) paragraph 2.2.2, but instead require that the intermediate dry-docking is to be linked to the intermediate survey and include a requirement to carry out surveys and thickness measurements of the lower portions of the tanks for oil tankers. (similarly, cargo holds/water ballast tanks for bulk carriers)

GPG is advised to note that the proposed requirement in paragraph 4.2.4.3 may result in a third dry-docking within the 5-year period of the classification certificate in case that a dry-docking is carried out prior to the window for intermediate survey.

The Chairman of WP/SRC suggests that GPG approves UR Z10.1 with high priority and allows PermSec in the meantime to start the work to amend and typeset UR Z10.2 and URZ10.3 with respect to the intermediate dry-docking requirement, as well as introducing the appropriate changes to UR Z10.2 and UR Z10.3 with respect to MSC 74/24/Add 1-Annex 17.

Note:

1. GPG tasked WP/SRC to review dry-docking survey requirements in Z10.2-4 and Z3 to harmonize them with those in Z10.1 (Rev.9) and reflect in Z3 the interim application of bottom survey requirements as introduced in MSC/Circ. 1013 (Res A.746(18)).

   Task 101, Target 2Q-2002

2. GPG confirmed (s/n 1060c) that 7.1.3 of A.744(MSC 74/12/Add.1/Annex 17/page 6), as quoted below, should not be included in Z10s.

   "7.1.3 Thickness measurements are to be carried out within 12 months prior to completion of the periodical survey or of the intermediate survey."

   Reason: The above sentence will restrict the 15 month and 18 month survey window for TM during the intermediate and special surveys respectively.

3. GPG confirmed that 7.1.4 of A.744(MSC 74/12/Add.1/Annex 17/page 6), as quoted below, should not be included in Z10s:

   "7.1.4 In all cases the extend of the thickness measurements should be sufficient as to represent the actual average condition."

   Reason: No compelling need, in view of MSC 74/12/Add.1 being adopted by MSC 75(May 02). IACS will live with this not harmonized sentence.

4. For IACS Council decisions to improve bulk carrier safety, see the TB for Revision 12 of Z10.2.

Submitted by WP/SRC Chairman

UR Z10.1(Rev.11) and Z10.2(Rev.14)

(July 2003)

Technical background

Part A: Survey Reporting Principles

1. Objective

WP/SRC Task 80 – Survey Reporting Principles

2. Points of discussion

The WP/SRC carried out this task according to the work specification of Form A (Rev.1) and reported the outcome on 18 December 2002 as follows:

- Review of NMD's report on "Sinking of Leros Strength", dated 6 July 2000 and the recommendations in section 5.3
- Review of IACS Council's reply, dated 22 August 2000 to those recommendations
- For recommendations 1.1, 1.2, 1.3 ,3, 4.2, 5 and 6, best practices have been identified by information exchange amongst Members and discussions at three WP-meetings.
- Harmonised survey reporting practices fulfilling, in so far as practicable, the recommendations of NMD have been included in the revised tables attached.
- Standard survey reporting terminology (recommendation 2) is in the process of being prepared and will be submitted to GPG for approval as an IACS Recommendation with the title "Surveyor's Glossary". The completion of the glossary has been delayed somewhat due to pending illustrations of typical hull structures.

Council approved on 14 July 2003 (2249_).

***

Part B: Incorporation of CAS related requirements into UR Z10s

2. Objective

WP/SRC Task 106 – Incorporation of CAS related requirements into A.744

2. Points of discussion

The WP/SRC carried out this task according to the work specification of Form A and reported the outcome on 27 May 2003.

- Since CAS was developed for tankers only, WP/SRC considered whether there is any need to further develop/modify requirements in CAS with respect to bulk carriers. Hence, amendments to Z10.15.5.5(rafting), 5.6(survey planning), 8.2.2(different survey stations) and Table 1(close-up survey).
- IACS will submit its proposed amendments to Res A.744 as a result of this revision.
- NK GPG suggested that the word "alone" be inserted after "rafting" in Z7 and Z10.1(5.5.5)~10.5.
    - WP/SRC had considered this and felt that the insertion of the word "alone" will create a loophole as the text "Rafting alone will only be allowed..." could be interpreted that other means of access have to be used. Besides this wording would impede the use of rafting for survey of side and bottom structures of the spaces.
    - GPG considered that rafts/boats should be accepted as a means to move about within a tank to gain access to any temporary platforms that may be erected. Consequently, the wording of 5.5.5 was re-drafted and split into three parts (5.5.5~5.5.7) beginning with "*Rafts or boats alone may be allowed for inspection of the under deck areas…*"

      The same wording will be introduced into Z10.3, Z10.4, Z10.5, Z7 and Z7.1.

Approved on 08/08/2003 (0237h)

Prepared by the Permanent Secretariat

22 July 2003

WP/SRC Task 102
HARMONIZATION OF UR Z7s AND Z10s

Technical Background
UR Z7 (Rev. 11)
UR Z7.1 (Rev. 2)
UR Z10.1 (Rev. 12)
UR Z10.2 (Rev. 17)
UR Z10.3 (Rev. 7)
UR Z10.4 (Rev. 2)
UR Z10.5 (Rev. 1)

Contents:

1. Objective

To amend UR Z7s and Z10s in order to make the texts of the above-mentioned URs consistent eliminating all the differences both in substance and in wording (WP/SRC Task 102).

2. Background

In the process of approving UR Z10.4, GPG found it necessary to amend the other existing URs Z10.1, Z10.2, Z10.3, Z10.6 and Z7 in order to eliminate any inconsistencies existing among them.

3. Methodology of work

The WP has progressed its work through many sessions, both during the periodical meetings and dedicated meetings restricted to a Small Group of Members (BV, DNV, GL, LR, RINA) who developed the work in order to be more efficient. All the proposed amendments of the Small Group have regularly been circulated to all Members for comment and agreement.

4. Discussion

4.1 The WP/SRC has completed a comprehensive comparative review of UR Z7 and Z10s, and identified inconsistencies which existed among them. During this review, attention was given to the severity of the requirements applicable to the same spaces/structural areas on different types of ESP ships. As a result, the inconsistencies were eliminated making the URZs harmonized. However, there has been no change to the scope and extent of the survey requirements.

4.2 The starting point for each UR was the most updated version available at the time of commencement. Any revision to the URZs, which were introduced during this task, was taken into account. As for instance, the UR Z10.1 was initially amended based on Rev. 9, while the last amendments are based on Rev. 11 and the UR Z10.2 was initially amended based on Rev. 13, while the last amendments are based on Rev. 16. The proposed revisions of URs Z10.1 and Z10.4 have not been numbered, as there will be revisions to those URs before the revisions introduced by the Task 102 are adopted. In fact, GPG is currently developing a Revision 12 of Z10.1 with the view to introducing significant improvements in the survey regime for ballast tanks (including combined cargo/ballast tanks) of oil tankers and UR Z10s applicable to oil tankers will also have to be revised by incorporating the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005 (see 4.3 below).

4.3 Also, in harmonizing UR Z10.1 and Z10.2 care has been taken to align the corresponding text with that of IMO Res. A.744(18). However, it has been noted that the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005, have not been incorporated into the IACS UR Z10s applicable to oil tankers. It seems that the updating of the above-said UR Z10s will be done by the Perm Sec and reviewed by the WP/SRC Chairman and then circulated for adoption by GPG with concurrence of Council Members for uniform application from 1 January 2005. It is understood that the revisions of the UR Z10s affected by those amendments will not include the changes introduced by the Task 102, as the implementation date proposed for those changes is 1 January 2006 (see below **6. Implementation**).

4.4 In the course of the work the WP has been developing for more than two years, several additional Tasks were assigned to the WP by GPG which affected the development of Task 102. The additional tasks which have been taken into account are the following:

1) In the course of Council discussion on UR Z10.6 (General Cargo Ships), certain inconsistencies were identified between Z10.6 and other Z10s. WP was instructed to expedite Task 102 (1060gIAa, 12 June 2002);
2) WP was instructed to include “Survey Planning for Intermediate Survey” into harmonization work (2108_IAa, 12 July 2002);
3) GPG instructed WP to consider whether Z10.6 should be re-assigned as Z7.1, in connection with the harmonization work. 1060gIAb, 20 Sept 2002.

Z7.1 developed;

4) Partial outcome (Z7 and Z7.1) was submitted to GPG on 17 July 2003(1060g). Council decided that approval of Z7(Rev.10) and Z7.1(Rev.2) is postponed until the harmonization is completed (1060gICb, 6 April 2004);
Council Chairman instructed WP/SRC to Members' comments on the draft revision of UR Z7 and Z7.1 (collected under s/n 1060g, 1060gNKi (30/03/2004) in particular) on 6 April 2004.

5) GPG tasked WP to include the amendments to Z10.2 / Z11 (BCs with hybrid cargo hold arrangements), deleting sheets 15 and 16 for ore carriers, into the harmonized UR Z10s (2212aIGa, 19 Jan 2004);
6) GPG tasked WP to consider whether the requirements relevant to examination of Fuel Oil Tanks in the cargo area at each Special Survey should be put into Z 10s, and internal examination of FOT at Intermediate Survey after SS 2 is needed. (1060gIAf, 30 Jan 2004);
7) GPG tasked WP to harmonize tank testing requirements in Z7s and Z10s. (3006lIAa, 5 April 2004);
8) GPG tasked WP with Task 108 - Develop uniform survey requirements for air vent pipes including the welded connection to deck. Z22 developed. GPG instructed WP to incorporate Z22 into the harmonized Z10s;
9) GPG tasked WP with Task 114 - Verification and signature of TM reports. REC 77(Rev.1) developed and approved on 29 July 2004. Council approved parallel amendments to Z7.1 and Z10s (TM Forms included) and instructed WP to incorporate these into the harmonized Z10s:
    - Recommendation No.77 was revised (Rev.1, July 2004);
    - Z7.1 para.6.3.2 and Z10s para.7.3.2 so amended.
    - "Surveyor's signature" is deleted from all TM Forms in Z10s;
    - A note is added to Annex II(Z10s) declaring that Annex II is recommendatory.

   WP/SRC's investigation into Members' practice in dealing with verification and signature of TM reports is annexed for record keeping purpose. See Annex 2.

10) GPG tasked WP to consider the BV comments on "TM may be dispensed with…." and include the findings into the harmonized Z10s (2219iIAa, 7 April 2004).

5. Agreement within the WP/SRC

All Members have unanimously agreed the attached final versions of UR's.

6. Implementation

WP/SRC is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming Council adoption in December 2004, WP/SRC would propose January 2006 as implementation date.

Annex 1: TB for UR Z10.1(Rev.12, C49 amendments, see Permsec's note 1 below)
Annex 2: WP/SRC Task 114, verification and signature of TM reports(see 9 above).
Annex 3**:** TB for revision of UR Zs concerning "anodes".

Note by the Permanent Secretariat

1. Annex 1 to this TB contains background for amendments to UR Z 10.1(Rev.12) relating to FAIR/POOR/GOOD (C49 amendments). Council at its 49th meeting (June 2004) agreed/decided that comparable changes should be added to Z10.3 and Z10.4.

2. Appendix 3 "TM sampling method" has been added to UR Z10.1 and Z10.4 to keep them consistent with IMO Res.MSC.144(77). The amendments to A.744 contained in MSC.144(77) entered into force on 1 January 2005. *(GPG s/n 4181)*

Under s/n 4072g, paragraph **2.4.6** of UR Z10.1 and **2.4.6** and of UR Z10.4 (paragraph numbering is now harmonized) were amended in order to provide a link between the main text of the UR Z10.1 and 10.4 and the new Annex III Appendix 3 containing the MSC Res.144(77).

Further, it was agreed that the requirements for evaluation of longitudinal strength of the hull girder (as written in MSC.144(77)) should not be required for Intermediate Survey unless deemed necessary by the attending Surveyor. This is covered in 4.2.3.1 and 4.2.4.1 of Z10.1 and Z10.4.

3. GPG agreed that the amended UR Zs should be implemented from 1 July 2006 altogether.

4. DNV's proposed amendments to UR Z10.1, Z10.3 and Z10.4 concerning annual survey of ballast tanks were agreed by Council (1060gICq, 27 June 2005). See Appendix 2 to Annex 1.

5. Annex 3 contains a TB for revision of UR Zs concerning "anodes".

Date: September 2004
Prepared by the WP/SRC

– – –

Annex 1 to Technical Background
UR Z 10.1 (Rev.12, C49 amendments(coating-related))

1. Objective

To introduce significant improvements in the survey regime for ballast tanks (including combined/ballast tanks) of oil tankers as matter of strategic concern and urgency to IACS, given the aging of both the single and double hull tanker fleets and the problems encountered with corrosion of ballast tanks in several shipping casualties.

2. Background

Draft amendments to UR Z10.1 were submitted to Council 47 (June 2003) and agreed in principle.

3. Discussion

There was particular concern over accelerated corrosion with age (as the thinner the material, the more rapidly the allowable diminution margin percentage disappears) especially where coatings have broken down. There is also a disincentive for any spend on maintenance of the structure of a ship within a few years of its statutory scrapping date.

Council discussion by correspondence had evolved to the position of substantive proposals – summed as follows (3095_ABa, 2 June 2003):

1. Enhance the Intermediate Survey in Z10.1, Z10.3 and 10.4 for Tankers after 2nd Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey). This corresponds to the latest revision to UR Z10.2.
2. At Annual Survey of ballast tanks with substantial corrosion, the overall survey is to be replaced by close-up survey with thickness measurements of the exposed area.
3. Proposed to task WP/SRC to re-consider the acceptance criteria for the rating FAIR further. For this, eliminate FAIR, leaving only GOOD and POOR redefined as appropriate.
4. Proposed to task WP/SRC to explicitly require close-up survey of Suspect Areas identified at the previous Special Survey.

Council 47 discussed the proposals(June 2003) as follows:

1. Definition of FAIR
   Council 47 agreed that "FAIR" would be retained as a rating and that GPG should instruct WP/SRC to redefine FAIR, so that there would be a clear differences between FAIR, POOR and GOOD. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have the same scope as Special Survey No.2(Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

   Based on the strong majority, Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

   > *DNV and NK stated that they could not accept a requirement for annual surveys of ballast tanks when the coating condition is less*

than GOOD and proposed that GOOD be changed to FAIR (3095_IGc, 30 June 2003)

2. ABS' proposed amendments to Z10.1(annual examination of BWTs in certain conditions) were approved.
3. C 47 agreed that the BWT coating requirements (Z10.1.2.2.3) for intermediate Survey after SS 2 should be the same extent to the previous SS.
4. Given the substance of the changes, the revised Z10.1 should be shown to Industry before adoption.
5. A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.

Following Council 47, the draft text of Z10.1(Rev.12) was distributed to Industry and discussed at the IACS/Industry meeting on 29 August 2003. Industry indicated that UR Z10.1(Rev.12) is acceptable, provided that appropriate IACS guidelines on coating repairs are developed.

The Small Group on Coating (SG/Coating) under WP/SRC prepared draft guidelines on coating repairs and considered the definitions of GOOD / FAIR / POOR. The SG/Coating did not change the definitions and found that the Guidelines provide useful clarifications on the definitions and criteria in achieving an industry wide uniform judgement of coating conditions as well as what is needed to restore GOOD conditions.
Further, an IACS/Industry JWG/Corrosion was established and met in February 2004. The outcome is (3095_IGh, 4 June 2004):

- Draft Guidelines on Coating Repair (IACS REC 87)
- Draft UR Zxx (mandatory coating of cargo tanks on oil tankers)
- Draft UI SC 122 (Rev.2) – mandatory coating of ballast tanks

4. Others

1. Z10.11.2.2bis - Definition of "Combined Cargo/Ballast Tank. …as a routine part of the vessel's operation and will be treated as a Ballast Tank. ...". By so amending, Z10s do not need to repeat "Ballast Tanks *and Combined cargo/salt water Ballast Tanks*" in addressing the ballast tanks. Hence, all the references to "*and Combined cargo/salt water Ballast Tanks"* were deleted.
2. Z10.1.2.2.1.2: The aim of the examination is ~~to be sufficient~~ to discover substantial corrosion…
   Comparable changes are to be added to other UR Zs wherever the same sentence occurs.
3. "IACS Guidelines for Coating Maintenance & Repairs for Ballast Tanks and Combined/Ballast tanks on Oil Tankers" are referenced where relevant.
4. Comparable changes are to be added to UR Z10.3 and Z10.4, after adoption of Z10.1(Rev.12).

Attached: Memo on Coating Matters (GPG Chairman)

9 June 2004
Prepared by the Permsec

Appendix 1 to Annex 1: **MEMO on Coating matters**

1. Background and discussion within IACS on UR Z10.1 (draft Rev.12) between 29/01/03 and 14/08/03

In view of the survey experience with oil tankers, it was proposed that all ballast tanks should be examined, routinely and uniformly, at annual surveys on ESP tankers exceeding 15 years of age. IACS should amend UR Z10.1 to require the examination of ballast tanks on such ships at each annual survey. This is simple, clear and thorough and not subject to interpretation. (2242_ABq dated 29/1/03)

Then, ABS modified the proposal asking, for tankers subject to URs Z10.1, Z10.3 and Z10.4, exceeding 15 years of age, that the current requirement - pertaining to annual examination of Ballast Tanks adjacent to cargo tanks with any means of heating - be deleted and replaced by a simpler and more stringent requirement that all Ballast Tanks be subject to survey at each subsequent annual survey where either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and the protective coating is not renewed at special survey or intermediate survey. This will ensure that all Ballast Tanks with substantial corrosion or protective coating which is not in GOOD condition at the time of special survey or intermediate survey will be examined at each subsequent annual survey on tankers exceeding 15 years of age. (2242_ABzb dated 14/3/03)
This was later expanded to include all tanks used routinely for ballast water, both ballast-only and cargo/ballast tanks (2242_ABzc dated 14/3/03).

ABS further reviewed the issue of the survey of salt water ballast spaces and combined cargo/salt water ballast spaces with ABS' governing bodies in light of recent casualties and survey findings on other tankers. Their review found an increasing amount of coating breakdown/failure and subsequent rapid wastage in key structures after Special Survey No. 2, i.e. after 10 years of age. These conditions are most prevalent in the under deck structure and the side shell structure in way of the deep loadline. In a number of cases the serious wastage has caused fracturing of the under deck longitudinals and in some cases fracturing has extended to the main deck structure. This led ABS to refine proposed amendments to URs Z10.1, Z10.3 and Z10.4 to require (2242_ABzf dated 9/5/03):

a. For Tankers exceeding 10 years of age

> Salt Water Ballast Spaces and Combined Cargo/Salt Water Ballast Spaces. For tankers exceeding 10 years of age, salt water ballast spaces and combined cargo/salt water ballast spaces are to be internally examined at each subsequent Annual Survey where substantial corrosion is found within the tank or where the protective coating is found to be less than GOOD condition and protective coating is not repaired. Internal examination to be an Overall Survey.

b. For Tankers exceeding 15 years of age:

Salt Water Ballast Spaces and Combined Cargo/Ballast Spaces. For tankers exceeding 15 years of age, salt water ballast spaces and combined cargo/ballast spaces are to be examined internally at each subsequent Annual Survey. Where substantial corrosion is found within the tank, or where the protective coating is found to be in less than GOOD condition and the protective coating is not repaired then in addition to an Overall Survey, under deck structure and the side shell structure in way of the deep loadline is to be subject to Close-up Survey.

NK and BV replied that the proposed amendments made by ABS need to be substantiated in a transparent manner with technical data that ABS may possess and put forward for further assessment and discussion. (2242_NKn dated 14/5/03 and 2242_BVz dated 16/5/03)

DNV (2242_NVn dated 2/6/03), having carefully considered the practical consequences of taking the ship off-hire for gas freeing etc. and being concerned about the difficulties to have these surveys executed in a safe manner and whether the intended safety benefits in implementing the proposed extended scope of the annual survey of Ballast tanks will be met, **proposed the following alternative measures** which would be as effective and may not have such delaying effects to the ship:

1) Enhance the Intermediate Survey in UR Z10.1, 10.3, and 10.4 for Tankers after the 2 Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey. (This will correspond to the latest revised requirements of UR Z10.2 for Bulk Carriers.)
2) At Annual Survey of ballast tanks with substantial corrosion the overall survey should be replaced by close up survey with thickness measurements of the exposed area. (An overall survey of these tanks does not give sufficient information of the development of the areas with substantial corrosion.)
3) Further we will not fail to mention that the WP/SRC has proposed to extend the close up survey in cargo and combination tanks to 30% from the 3 Special / Renewal Surveys.
4) **Experience has shown that the coating condition rating category FAIR has a tendency to be stretched too far into the POOR condition. We will therefore propose that we task the WP/SRC to reconsider the acceptance criteria for the rating FAIR further.**
5) We do also question the need for redefining the definition of combination tanks, particularly since the category I tankers which are the ships that normally are fitted with these type of tanks are to be phased out 2 to 4 years from now. However DNV will not oppose to such a redefinition.

DNV requested Members to consider the above as an alternative to the ABS proposal, bearing in mind that we ought to present this to the industry prior to deciding.

ABS (3095_Aba dated 2/6/03), having further considered its earlier proposals in light of NVn, submitted a revised proposal for consideration by Council at C47 and replied to the above 5 DNV proposals as follows:

1) ABS fully supports this proposal.
2) While ABS agrees with this proposal, it is in fact already provided for in Z7 (3.2.3) and Z10.1 (3.2.5.1)--which require that "Suspect areas (which include any area where substantial corrosion is found) identified at previous Special Survey are to be examined. Areas of substantial corrosion identified at previous special or intermediate survey are to have thickness measurements taken." To us, this implies that close-up survey of these areas is to be done at annual survey in conjunction with the thickness measurements. However, we can

agree to tasking WP/SRC to explicitly require "close-up" survey in this connection and to amend Z7, and all the Z10's, appropriately to make this explicit, if there is majority support for this.

3) We agree that this has been put forward to GPG by WP/SRC via 0237hNVb, 27 May. However, these additional CAS close-up survey requirements do not apply to salt water ballast tanks; only to cargo oil tanks and combined cargo/ballast tanks.
4) **We agree with this assessment and we propose that the only way to eliminate the subjectivity and raise the standard is to eliminate the category "FAIR" completely; leaving only "GOOD" and "POOR" redefined as follows:**
   "GOOD -- condition with no breakdown or rusting or only minor spot rusting.
   POOR -- any condition which is not GOOD condition."
5) ABS does not agree with this proposal. We are particularly concerned that we need a very thorough and robust survey regime for these tankers precisely because they are subject to mandatory phase out over the next several years. We are very concerned that without additional IACS requirements, these tanks will receive little or no inspection and maintenance by owners or others after their last special or intermediate survey, if no substantial corrosion is found at that time. Rapid, localized wastage in way of deteriorating coatings may pose significant hazard if the survey regime is not further tightened as we are proposing.

In conjunction with the above comments on DNV proposals, ABS further considered their previous proposal in ABzf and modified it as follows:

- **ABS simplified the proposal to require annual examination of all salt water Ballast Tanks and combined Cargo/salt water Ballast Tanks irrespective of age, when either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and is not repaired.**
- the requirement for annual (close-up) examination of salt water ballast tanks and combined tanks is already required in Z10.1 (3.2.5.1). ABS proposed adding it to 2.2.3 for clarity and emphasis so that all the conditions which may lead to annual examination of such tanks are listed together in one place.
- Since the principal problem that we are trying to address is rapid, localized corrosion in way of breakdown or deterioration of the protective coating, we are proposing that the coating condition should be found and kept in "GOOD" condition to obviate the need for annual examination. **The attached proposal is made together with the proposals in items 3.1 (intermediate following Special survey 2 to have same scope as prior Special survey) and 3.4 (eliminating "FAIR" and redefining "POOR" as any condition other than "GOOD" condition.**

ABS requested to decide on a course of action at C47 for tightening the survey regime for tankers. They agreed that industry be informed of Council's decisions in this regard prior to IACS making the decision public, but IACS should maintain its independence and take decisive action in this matter. Debate with industry can only lead to delay and to a watering down and compromising of these important requirements.

NK agreed to task WP/SRC to reconsider the acceptance criteria of "FAIR" for clearly define the border between "FAIR" and "POOR" condition. However, **NK strongly opposed the elimination of "FAIR" coating condition from UR Zs** because this can not resolve to remove subjectivity of coating assessment. The three-categorization system of coating condition should be retained. (3095_NKa dated 5/5/03)

<u>Outcome of C47</u>

At **C47**, it was agreed that “Fair” would be retained as a rating and that GPG should instruct WP/SRC to redefine “Fair”, so that there would be a clear differentiation between “Fair”, “Poor” and “Good”. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have same scope as Special Survey No.2 (Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

Based on strong majority support Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

This matter should be discussed with Industry prior to adoption of any UR by Council.

In a final summary, the Chairman proposed that a constructive dialogue with Industry should take place on the IACS proposal as set out in WP1 plus maintaining 3.2.5.2 modified to say that ballast/combined ballast/cargo tanks will be subject to annual survey when considered necessary by surveyors.

After discussion in the JWG (Industry/IACS), GPG should propose final rules for this matter to Council, including acceptable repair definition.

F**UA 17:** *To instruct WP/SRC to develop guidance on coating repairs and more precise definition of “Fair” coating condition.*

Once approved, these requirements should be incorporated into Z10.3 and Z10.4.

FUA 15

1) *To prepare a draft revision to UR Z10.1 incorporating C 47 decisions:*
   - *The definition of “FAIR” remains as it is;*
   - *ABS proposed amendments to Z10.1 (annual examination of BWTs in certain conditions) were approved;*
   - *C47 agreed that the BWT coating requirements (Z10.1.2.2.3) for Intermediate Survey after Special Survey No.2 should be the same extent to the previous Special Survey.*
   - *Given the substance of the changes, the revised UR Z10.1 should be shown to Industry (OCIMG/Intertanko first among others) before adoption for their review and comments.*
   - *A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.*

2) *GPG Members are to confirm the draft revision to Z10.1 in consultation with their WP/SRC members by correspondence. See 3095_IGa of 13/06/03.*

According to C47 FUA 15, GPG Chairman circulated (3095_IGa dated 13/6/03) draft amendments to UR Z10.1 as agreed in principle at C47.

Having received a number on comments, GPG Chairman (3095_IGb dated 27/6/03) informed that the Council Chairman confirmed that GPG is not to amend the principles agreed at C47, i.e. we are not empowered to change "GOOD" to "FAIR" as proposed by DNV and NK, nor to amend the definitions of "FAIR" and "POOR" as proposed by DNV.

DNV's intention to possibly lodge a reservation was noted, however the matter should be raised at Council and not be dealt with by GPG. An amended draft text incorporating the non-substantive changes proposed by Members was circulated.

DNV said that its understanding was that the draft should be circulated to the Industry (ICS, INTERTANKO, and BIMCO) prior to adoption by Council. (3095_NVc dated 30/6/03)

GPG Chairman (3095_IGc dated 30/6/03) circulated a draft amendment of UR Z10.1 for Council's agreement and use in discussions with the industry associations.
The draft was generally agreed by GPG but individual Members have requested that the following matters (which were deemed to be outside the remit of GPG in this task) be brought to Council's attention for further consideration:

1 DNV and NK stated that they can not accept a requirement for annual surveys of ballast tanks when the coating condition is less than GOOD and propose that GOOD be changed to FAIR.
2 In connection with item 1 above, DNV also propose to amend the definitions of FAIR and POOR in order to raise the standard of FAIR.

Council Chairman (3095_ICb dated 14/8/03) concluded that Council has agreed that the draft amendments to UR Z10.1 attached to IGc reflect Councils' decision taken at C47 and that they be circulated to industry associations.
Perm Sec was therefore invited to submit the draft to OCIMF and INTERTANKO in view of discussion at the IACS/ industry meeting on 29 August.

2. Discussion with Industry (29/08/2003 – 11/10/2003)

As requested by Council, the whole matter was presented to Industry during the "general matters" meeting with IACS held on 29 August 2003; comments from Industry were requested. In the following an extract from the minutes of the meeting (see message 3100aIAb dated 5 September 2003):

___________________________ from Meeting minutes _________________________________

4. & 5. Annual surveys of ballast tanks and IACS guidelines on coating repairs

M. Dogliani introduced the matter (see Items 4&5 in Appendix).

A. LinoCosta gave a presentation to show where concerns and decisions stand: too many cases when coating was considered fair at SS but problems occurred just after one/two years.

N. Mikelis commented on draft amendments to Z10.1 (Rev.11) stating that the extent of annual survey is not clear; it should be limited to the affected zones, e.g. coating breakdowns, only.
M. Guyader clarified that, in this draft amendments, it is expected an overall survey of the whole tank and a close up survey of the affected zones.
N. Mikelis noted that, in the draft amendments to Z10.1 (Rev.11), the intermediate survey at 12.5 years would have the same scope as the previous special survey and that needed a justification. See 7 a).
M. Dogliani said that Z10.1 (Rev.11) was adopted in August 2003 and will be introduced into IACS Societies' Rules over the next year.

Conclusions:
4.1 Industry shared IACS concerns on coatings and, in general, agreed with the draft amendments to Z10.1 (Rev.11) suggesting also extending them to Z10.2 on bulk carriers

4.2 Industry agreed that a guideline for surveyor on coating would greatly improve uniform application of so-amended Z10.1 including issues such as how to consider load bearing elements when judging GOOD/FAIR/POOR status and how to consider bottom pitting in connection with GOOD conditions
4.3 Industry will more precisely comment, by the end of September, the draft Z10.1 so as for IACS to finalise the matter, as planned, for the Council's December meeting.

Item	Title	Industry recommandation	IACS/ M. Dogliani Introduction
4 & 5	Annual survey of ballast tanks IACS guidelines on coating repairs	NN	**1. IACS is considering the following:** - **amend UR Z10.1 (draft circulated to Industry) to the effect that in case at Special Survey or Intermediate Survey the coating in a ballast tank is found less than GOOD, either GOOD conditions are restored or the tank's coating is inspected at each annual survey;** - **develop IACS guideline to assist an uniform application of the so modified (if adopted) UR Z10.1; the guideline should address which repairs are necessary to restore GOOD conditions from FAIR and POOR respectively and which are the criteria for the restored (after repair) situation to be rated as GOOD.**

______________________________ End of extract from minutes ____________________________

INTERTANKO commented (see R. Leslie email to GPG dated 25 September 2003):

- expressing their concern for the draft Z10.1 and underlining

a) targeting: concerns that, if not properly dealt with, Z10.1 would target all ships and not just those which need intervention; the view was expressed that guidelines would probably solve the matter;

b) definition: indicating that the current definitions of GOOD, FAIR and POOR is not clear enough and that the matter would be even worst with GOOD and NON GOOD; again it was indicated that guidelines could solve the matter;

c) expertise: expressing doubts on IACS' surveyors expertise and ability to judge coating conditions; in this respect they (hiddenly) suggest that IACS position is unclear when we say that we are not competent to judge the coating during construction but then we are competent to judge coating during operational life. Even if not explicitly stated, the impression is that also in this case guidelines would help.

Additionaly, INTERTANKO suggested a (quite detailed) set of assessment criteria.

The matter was then finally addressed at the TRIPARTITE Meeting (held in Soul on 29/30 September 2003). There Industry agreed that the way forward was the (joint) development of IACS guidelines (see minutes attached to message 3100_RIe dated 11 October 2003, an extract of which is reproduced below).

______________________________ Extract from the TRIPARTITE minutes ________________

Industry is concerned by the definition of GOOD/NOT GOOD in relation to coating repairs and acceptance criteria. Industry agreed that new guideline on this, which IACS is already producing, was the way forward.

_______________________________ End of the extract from the minutes __________________

3. Further developments

a) from the above, it was concluded that, provided the guidelines are sound, Industry would accept the concept of Z10.1 (draft) Rev. 12, therefore an IACS team and a JWG were established in order to progress the matter of the guidelines (among other related matters).
b) the team of IACS experts on coating developed draft guidelines and provided recommendations to GPG on the way forward (attached to message 3095bNVc dated 20 November 2003).
c) the guidelines were discussed within the JWG with Industry (see draft minutes circulated within GPG with messages 3095cIGd and 3095cIGe both dated 13 March 2004)
d) further suggestions and comments (as requested at the meeting) were provided by Industry (not circulated to GPG)
e) Bulk Carrier Industry is recommending that similar guidelines are developed in due time also for bulk carriers
f) at DE47 and MSC78, IMO is asking Industry and IACS to develop (compulsory) performance standards for coating of newbuilding (double hull spaces of DSS Bulk Carriers), a matter which is, indirectly related to the above one.

1 June 2004
M. Dogliani
IACS GPG Chairman
IACS JWG/COR Chairman

25 May 2005

To: Mr. B. Anne, Chairman of IACS Council,
cc: Council Members, IACS Perm. Sec.

Ref.: My mail NVr dated 20 May 2005

DNV have further studied the amendments to UR Z10.1, Z10.3, and Z10.4, and as a result are presenting the following as a compromise solution:

General comment:
From the comments by other Members it is obvious that there is reluctance to accept annual surveys of ballast tanks with a common plane boundary to heated cargo tanks in the case where the coating is in good condition. This is particularly unreasonable as at the same time we enhance the Intermediate survey of Tankers between 10 and 15 years to also include examination of all ballast tanks, meaning that all ballast tanks will be close up surveyed with 2-3 years intervals from the ship is 10 years old, with the possibility for the surveyor to require thickness measurements and testing of the tanks to ensure the structural integrity of the tanks if necessary.
It is also proposed for the Intermediate survey between 5 and 10 years, to increas the scope from representative to all ballast tanks, a requirement DNV find to strict, and require that we here keep the original text.
If a ballast tank is found to have coating in GOOD condition at the renewal or intermediate survey, a deterioration of the tank beyond structural reliability is very unlikely even if the tank has a common plane boundary to a heated cargo tank.

DNV finds it particularly unreasonable to have this requirement to apply to double hull tankers for the following reasons:
- these ships have double hull and the risk of pollution is here much reduced,
- the double hull is constructed with small spaces giving improved structural reliability,
- almost all double hull tankers below VLLC have heated cargo tanks, and all ballast tanks have common plane boundaries to these tanks, meaning that this requirement will apply to a major part of the tanker fleet in the future,
- the ballast tanks of double hull tankers are so designed that a general examination of these tanks will be identical to a close up survey,
- survey of ballast tanks of double hull tankers will mean either gas freeing of all cargo tanks or at least dropping the inert gas pressure of all cargo tanks in addition to proper airing of all ballast tanks.

Since the single hull tankers will be faced out in the near future, and for clear political reasons, DNV will as a compromise proposal to keep paragraph 2.2.3.1 and 4.2.2.2 in Z 10.1 as amended by Council (ref. IAo) but amend it to not include 2.2.3.1.e, 4.2.2.2.e and last paragraph of 3.2.5.1 in Z10.3 and Z10.4. In addition we request that the original text of 4.2.2.1 is kept.
If BV, ABS and other Members can accept this DNV is willing to drop our reservation presented at C49.
DNV's proposal will then be as follows:

Z10.1:

2.2.3.1: This paragraph can be accepted as is for the reasons stated above.
3.2.5.1: This paragraph is accepted as amended.
4.2.2.2: This paragraph can be accepted as is for reasons stated above.

For other comments to Z10.1 see NVo and NVp.

Z10.3:

2.2.3.1.e to be deleted.
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept."For tanks used for water ballast ---"
4.2.2.2.e to be deleted

Z10.4

2.2.3.1e to be deleted
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept, "For tanks used for water ballast --"
4.2.2.2.e to be deleted.

For details see attached document where the text for the requirements in Z10.3 and Z10.4 that DNV will accept is stated.

Best Regards

Arve Myklebust
on behalf of
Terje Staalstrom
DNV IACS Council Member

Annex 2 to TB (Harmonization Z10s)

WP/SRC Task 114 "Clarify the procedure of verification and signature of the thickness measurement report"

Item No.	Item	ABS	BV[1]	CCS	CRS	DNV	GL	IRS	KR	LR	NK	RINA	RS
1	**Verification onboard**	.											
1.1	Minimum extent of measuring points for direct verification by attending surveyor specified	No	No	No	No	No	No	No	Yes	No	No	Yes	No
1.2	Preliminary TM record to be signed upon completion of the measurements onboard	Yes	Yes [7]	Yes	No (copy taken)	No[3]	No[6]	Yes	Yes	Yes	Yes	No[8]	No
2	**Final TM report**												
2.1	Signature of all pages in TM record required	No	No	No	Yes	No	Yes	Yes	No	No	No[5]	Yes	Yes
2.2	Signature of 'cover' ('general particulars') page only	Yes	Yes	Yes	No	Yes	No	No	No[4]	Yes	Yes	Yes	No
2.3	Measuring points verified by attending surveyor required identified in TM record and signature of the corresponding pages required	No	No	Yes Without signature	Yes	No	No	No	Yes	No	No	No	No

2004-04-20

[1] Instructions not clear regarding signature of the thickness measurement record

[2] Signature on front and last page, stamp on all other pages, or signature on each page (IACS TM forms)

[3] Upon completion of measurements onboard a draft report in electronic format (DNV TM template, including operator's notes as relevant) to be given to attending surveyor

[4] Signature of cover page, pages of meeting record and pages of attended measuring points

[5] Each page to be signed in case of 'loose-leaf' type record

[6] Preliminary TM record has to be passed to the Surveyor, signed by the Operator

[7] The only measures which the Surveyors can certify exact are those for which that they have seen the results on the screen of the apparatus. That means in fact few points in comparison with the numbers of recorded measures.

8) The Surveyor reviews the TM record for completeness and assessment of TM readings, but no signature required.

Annex 3: **Technical Background**
(May 2005)

UR Z7s and Z10s (Corrosion Prevention System)

1. Objective:

To clarify whether the survey of anodes is a class matter, and if so, whether acceptance criteria for anode should be developed.

2. Method: GPG by correspondence (5037_)

3. Discussion

3.1 BV initiated GPG discussion as follows:

Paris La Défense, 8 Mars 05

1 - We have noticed that, in the draft UR Z's (7.1, 10.1 to 10.5) issued further to the WP/SRC Task 102, the original sentence "......the examination may be limited to a verification that the hard protective coating remains efficient......" has been replaced by ....that the corrosion prevention system remains efficient....". in a number of paragraphs (such as , for instance, Z 7.1, 4.2.3.1 a) ; Z 10.2 4.2.3.3 ;), in line with IMO Res.A744(18).

2 - However, a corrosion prevention system is defined, in the same UR Z's and in IMO Res.A744(18) , as being either a full hard protective coating or a full hard protective coating supplemented by anodes.

3 - The above would mean that the survey of the anodes is a classification matter.

4 - However, whereas coating conditions are defined as good or fair or poor, there are no criteria in the IACS URs and IMO Res. A744(18) for the anodes condition.

5 - Assessing the anodes condition to confirm that they "remain efficient" looks to BV to be a quite difficult task for the ships in service Surveyor.

6 - Member's view and interpretations on the following would consequently be appreciated:
- do Members consider that the above requirements in IACS URs imply that survey of anodes is part of the classification ?
- do Members consider that the above requirements in IMO Res. A 744 (18) imply that survey of anodes is mandatory?
- if yes, what is the acceptance criteria to conclude that the anodes" remain efficient" ?

3.2 The majority of GPG Members replied that they did not include requirements for anodes in their class rules.

LR / ABS / DNV / KR / NK / RINA / RS were of the view that the condition of any anodes fitted should be recorded for information purposes as the survey of anodes is neither a classification matter nor a mandatory requirement in IMO A.744(18) and has no impact on future surveys (5037_LRa**). [**Note; LR further clarified that “Whilst I agree that the performance of anodes is not normally a class matter LR does require that as part of Special Survey on oil tankers : "The attachment to the structure and condition of anodes in tanks are to be examined ." Therefore we cannot say that 'the survey of anodes is not a classification matter'**. 5037_LRb]**

However, GL said that "for GL, anodes are a matter of class and as such are subject to plan approval as well as surveys. In case of missing or worn-out anodes we issue a condition of class"(5037_GLa&b).

CCS advised that its rules have a general requirement relating to anode survey, which is only conducted, through sampling, during construction, docking survey or where there is a definite requirement for the survey of ballast tanks.

NK proposed that the following footnote be added to Z7s and Z10s:
"The survey of anodes is not a classification matter." No majority support was achieved.

4. Conclusion

RINA suggested to simply amend the definition of "Corrosion Prevention System" in paragraph 1.2.9 of UR Z7 (and, of course, the paragraphs in all the other UR Zs containing the definition of "Corrosion Prevention System") in order to eliminate any reference to anodes. This proposal would leave room for Societies willing to include additional class requirements for anodes to do so in their Rules.

GPG agreed.

RINA proposed amendments to paragraph 1.2.9 of UR Z7 and corresponding paragraphs in all other UR Zs (5037_RIb, 6 April 2005)

1.2.9 Corrosion Prevention System

A corrosion prevention system is normally considered ~~either:~~ a full hard protective coating.
~~.1 a full hard protective coating, or~~
~~.2 a full hard protective coating supplemented by anodes.~~
Hard protective coating is usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specifications.
Where soft coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

Annex: Council Chair's conclusive message.

6 May 2005
Permsec

Annex. (5037_ICb, 15 May 2005)

To : All IACS Council Members
c.c : Mr. R. Leslie, IACS Permanent Secretariat

Ref. Mr G-Y. Han's message IAa dated 6 May 05
Message ICa dated 6 May 05
Admiral R.E. Kramek's message ABb dated 13 May 05

Paris La Défense, 15 May 05

1 - All Members have agreed with the texts attached to Mr Han's message.

2 - Further to ABS comments the reference to anodes is to be deleted in Annex I and in tables IX (IV) and IX(II).

3 - further to ABS questions regarding what IACS plan to do regarding IMO and A.744(18) further to IACS deletion of reference to anodes from the UR Z7's and UR Z10's it is to noted that:

The Item 1.2.9 in UR Z1O.1 and relative items in these URs states
1.2.9 10 Corrosion Prevention System: A corrosion prevention system is normally considered either:
.1 a full hard protective coating, or
.2 a full hard protective coating supplemented by anodes.
Hard Pprotective Ccoating is to usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specification.
Where Soft Coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

- therefore the anodes are not considered as the main means of protection against the corrosion It is only a supplement;

- there is no provision in UR Z7's and Z10's to evaluate the level efficiency of the anodes;

- there is no specific requirements in case of lack of efficiency of the anodes.

The experience has shown that ballast tanks only protected by anodes are subject to corrosion when the anodes are becoming less efficient.

The anodes are active only when immersed by sea water. Therefore the upper part of the ballast tanks are not protected when the ballast is full of water and the ballast is not protected when it is empty..

The ships operators are reluctant to replace the anodes especially in upper part which request fitting of scaffolding fo welding the anode supports to the structure.

The above arguments justify the reasons why IACS consider that the anodes are not class item.

4 - These arguments can be used by IACS Members attending the WG bulk carriers at MSC 80 to try to obtain deletion of the reference to anodes in A. 744(18).

Best regards,

Bernard Anne
IACS Council Chairman.

Technical Background

UR Z10.1(Rev.13, Jan 2006)
UR Z10.2(Rev.18, Jan 2006)-separate TB
UR Z10.3(Rev.8, Jan 2006)

UR Z10.5(Rev.2, Jan 2006)

Part 1. Z10s – para. 1.4 and 7.1.3

Part 2. Z10s – para. 5.5.4 and 5.5.6

Survey Panel Task 22 – Amend applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

Technical Background

Z7(Rev.12)
Z7.1(Rev.3)
Z10.1(Rev.13, para.1.4 & 7.1.3)
Z10.2(Rev.18, para. 1.4 & 7.1.3)
Z10.3(Rev.8, para. 1.4 & 7.1.3)
Z10.4(Rev.3, para. 1.4 & 7.1.3)
Z10.5(Rev.2, para. 1.4 & 7.1.3)

1. **Objective**

To amend the applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

2. **Background**

IACS QC findings, through audits of numerous Societies, which indicated concerns over Surveyor attendance and control of thickness measurement processes.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

To align Close-up survey requirements and thickness measurements in the applicable URZ7s and URZ10s, in accordance with PR19, all Panel members agreed through correspondence and a final vote at the fall Survey Panel meeting, that URZ7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 should include in the applicable sections of the noted URs as proposed by the Survey Panel the wording " In any kind of survey, i.e. special, intermediate, annual, or other surveys having the scope of the foregoing ones, thickness measurements of structures in areas where close-up surveys are required, shall be carried out simultaneously with close-ups surveys."

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Technical Background

UI SC 191 (Rev.2, Oct 2005)

&

UR Z10.1 (Rev.13, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.2 (Rev.18, para. 5.5.4 and 5.5.6, Jan 2006)
UR Z10.3 (Rev.8, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.4 (Rev.3, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.5 (Rev.2, para.5.5.4 and 5.5.6, Jan 2006)

1. Objective

- to confirm whether the guidelines for approval/acceptance of alternative means of access (now REC91, ex Annex to UI SC191) is mandatory or non-mandatory.
- to consider other safety related proposals.

2. Background

The DNV proposal to submit the UI SC191(Rev.1, May 2005, Annex 1) to IMO DE49 triggered a number of discussion points that led to amendments to the following resolutions:

UI SC191(Rev.2)
New REC 91
REC 39(Rev.2)
UR Z10s

Points of Discussion

3. Is the Annex to UI SC191(Rev.1, May ’05, guidelines for approval / acceptance of alternative means of access) mandatory or non-mandatory ?

   Answer: Non-mandatory. Hence, re-categorized as new REC 91.

4. Limitation of use of rafts in bulk carrier holds

   DNV proposed that conditions for rafting should be limited to areas, such as anchorage or harbour, where swell conditions are limited to 0.5m. After discussion, GPG approved the ABS’ alternative proposal to use the swell condition as a basis to determine the appropriateness of rafting, instead of geographic areas(harbours or anchorage). 5.5.4 of Z10.2 refers.

RINa proposed that para 5.5.4 should be included in all the Z10s. NK's objection is recorded as follows (3037hNKq, 29/08/2005):

> 1. With regard to RIm of 26 August 2005, NK considers that the proposed amendment to 5.5.4 should be limited to UR Z10.2.
>
> 2. Rafting survey for tankers are actually carried out on the open sea from a discharge port to a loading port and in such situation the rise of water within the tanks would always exceed 0.25m. It is different situation from rafting survey for hold frames of bulk carriers normally conducted in a harbour or at an anchorage.
>
> 3. If the same requirement applies to tankers, any rafting survey for cargo oil tanks and ballast tanks of tankers would be prohibited. This is not practicable under present survey procedure for tankers.
>
> 4. Therefore, NK can not support Laura's proposal that the proposed amendment to 5.5.4 of UR Z10.2 is introduced into the other URs and new Recommendation.

For compatibility with the IMO's mandatory requirements*, GPG decided to add the same amendment to all the UR Z10s.

*

- Appendix 4 to MEPC.99(48) ' Mandatory requirements for the Safe Conduct of CAS Surveys'
- MSC.197(80) – amendments to A.744918), Annex A for DSS and SSS bulk carriers and Annex B for single and double hull oil tankers.

As a consequence, 5.5.1 of REC 91(ex Annex to UI SC191) was also amended:

-to remove the reference to dynamic /sloshing (as the 0.25m rise was considered negligible);

-to refer to the rafting conditions contained for cargo holds in Z10.2 and Z10.5 and for oil cargo tanks in Z10.1 and Z10.4.

5. Means of access from longitudinal permanent means of access within each bay to rafts

GPG reviewed the proposal that the following text be added to Z10s:

A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay.

(Technical Background: for the safety of surveyors)

There may be ships which are arranged in accordance with para b, page 8 of the Annex to the current SC 191 (i.e., no means of access from the LPMA in each bay to a raft is required) and therefore could not be rafted if the sentence proposed by RINA("A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay") is included in the Z10's.
GPG therefore agreed not to include this sentence in Z10s.

For the same reason, the same sentence was not added to Rec.39.

Finally, GPG added the following sentence to UI SC191(interpretation for II-1/3-6):

> *A permanent means of access from the longitudinal platform to the water level indicated above is to be fitted in each bay (e.g permanent rungs on one of the deck webs inboard of the longitudinal permanent platform).*

6. Implementation

It was agreed that the revised UI SC191 be implemented to ships contracted for construction 6 months after adoption by Council.

UI SC191 was also edited in line with IMO MSC/Circular. 1176, leaving its mandatory language (is/are to, shall) unchanged.

> (Note: UI SC191(Rev.2) makes references to the following new Recommendations:
> - REC 90: Ship Structure Access Manual
> - REC 91: Guidelines for approval/acceptance of Alternative Means of Access)

23 September 2005
Permanent Secretariat
Updated on 13 Oct 2005.

Technical Background

UR Z10.1 (Rev.14), UR Z10.2 (Rev.23), UR Z10.4 (Rev.5) & UR Z10.5 (Rev.5)

Survey Panel Task 3 – Maintenance of Alignment/ Compatibility of IACS URs and IMO survey requirements

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements regarding resolution MSC 197(80) – amendments to A744(18)

2. **Background**

IMO survey requirements to ESP vessels as amended in A744(18) as noted in MSC 197(80), with an implementation date of 1 January 2007.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel members, at the fall 2006 Survey Panel meeting, finalized the amendments to the applicable URs due to changes adopted at MSC(80).
Additionally, Members noted that URZ10.4 paragraphs 2.2.3.1 and 4.2.2.2 does not require examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80). The survey panel agreed that if this is the position that IACS would like to take regarding double hull tankers, then it should be brought to the attention of IMO at the next IMO meeting, DE50 in March 2007.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve the amendments, the Survey Panel would propose January 2008 as an implementation date, although the IMO implementation date is January 2007.

Submitted by Survey Panel Chairman
9 January 2007

GPG discussion

All members agreed to omit the requirement of examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80), from URZ10.4 for double hull tankers and

that it should be brought to the attention of IMO at DE50. In addition ABS proposed that paragraphs relating to similar requirements in URZ10.1 should also be deleted for consistency and this was agreed by members.

Members also made a number of minor/editorial corrections to the text prior to their approval of the revised documents.

Added by Permanent Secretariat
23 April 2007

Technical Background

URs Z7(Rev.15), Z7.1(Rev.5), Z7.2(Rev.1), Z10.1(Rev.15), Z10.2(Rev.26), Z10.3(Rev. 9), Z10.4(Rev.6), Z10.5(Rev.8) – November 2007

Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions

1. Objective

To review IACS Resolutions annually and discuss or propose amendments as deemed necessary.

2. Background

This proposed amendment to all URZ7s and URZ 10s was raised by the Panel member from DNV due to Owners crediting tanks concurrently under intermediate and special survey.

3. Methodology of Work

Survey Panel members through correspondence.

4. Discussion

The Panel member from DNV raised the issue of Owners having the ability of crediting spaces and thickness measurements only once in a 54 month interval, due to the availability of concurrent crediting of spaces and thickness measurements due to the flexible time window that is currently allowed between the intermediate survey and the special survey.
After a presentation and discussion lead by the DNV Panel member, all Survey Panel members agreed to the argument given by DNV, and further agreed to make the necessary changes in all URZ7s and URZ10s where Owners are not allowed to concurrently credit surveys and thickness measurements of spaces.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG approve to the amendments, the Survey Panel would propose January 2009 as an implementation date.

Submitted by Survey Panel Chairman
22 October 2007

Permanent Secretariat note (December 2007):

During GPG discussion DNV proposed that *"since this matter will be discussed between Owner and Class mainly in connection with the forthcoming Special Survey, DNV would prefer to locate this text, not only as part of Intermediate Survey, but also as a new text for the Special Survey."* This was supported by BV, ABS, RINA and KR.

The revised documents were approved, with DNV's proposal and an implementation date of 1 January 2009, on 15 November 2007 (ref. 7690_IGb).

Technical Background

URs Z7(Rev.16), Z7.1(Rev.6), Z7.2(Rev.2), Z10.1(Rev.16), Z10.2(Rev.27), Z10.3(Rev.11), Z10.4(Rev.7) and Z10.5(Rev.9) - March 2009

Survey Panel Task 62:

A) Harmonization of UR Z10.1, Z10.2, Z10.4 and Z10.5 with UR Z10.3 with respect to items 5.5.4.4 and 5.6.2.

B) Harmonization of UR Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 with UR Z7.2 with respect to the definition of the corrosion prevention system and with respect to the footnote 1 related to semi-hard coatings.

C) Harmonization of the definition of Ballast Tank in UR Z7(Rev.14)

1. Objective

A) Amend the texts of items 5.5.4.4 and 5.6.2 in Unified Requirements Z10.1, Z10.2, Z10.4 and Z10.5 in order to align them with those in UR Z10.3, in which they were changed while performing Task 55, whereas in the other UR Z10s they were kept unchanged on the grounds that this change was out of the scope of Task 55.

B) Amend the definition of “Corrosion Prevention System” and include a Footnote 1 related to semi-hard coatings in Unified Requirements Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 in order to align them with those adopted in UR Z7.2, when this new UR was issued.

C) Amend UR Z7 (Rev. 14) in all items where the term “Ballast Tank” is used in order to get them harmonized with the definition itself.

2. Background

The task, as regards item A), was triggered by a Member Society, while performing Task 55, on the grounds that this part was out of the scope of the task and then should have been dealt with in a separate task.
The task, as regards item B), was triggered as a consequence of the “New Business action item 2” of the Minutes of the September 2008 Survey Panel meting, for sake of harmonization of the various URZs.
The task, as regards item C), was triggered as a consequence of the “Task 54-Examination of Double Bottom Ballast Tanks at annual surveys” of the Minutes of March 2008 Survey Panel meeting, for sake of harmonization of the definition of Ballast Tank in UR Z7(Rev.14).

3. Discussion

The task was carried out by correspondence. All the amended texts for the affected URs were prepared by the Survey Panel Member who had chaired the PT on Task 55, in accordance with the Form A approved by GPG. In addition to the objectives outlined in the Form A, an amendment was added to item 1.3.1 of UR Z10.2 and UR Z10.5 in which the reference 3.2.3.6 in the last item of the list was replaced by 3.2.3.10 as can be correctly verified in the text.
The amended URs were circulated to all Survey Panel Members for review, comments and agreement. The texts of the URs were unanimously agreed by all Members.

4. Implementation

The Survey Panel is of the view that the Member Societies need at least 12 months from the adoption date to implement these amendments into their class rules/procedures. Therefore, in the first version of all amended URs the following implementation sentence should be proposed:

Changes introduced in Rev .xx are to be uniformly applied by Member Societies and Associates for surveys commenced on or after [not less than 12 months after the adoption by GPG/Council].

Since it is common practice and convenience to have implementation dates either on 1st January or on 1st July of the year, the Survey Panel proposes the 1st July 2010 as implementation date, if GPG/Council approve the URs not later than 30 June 2009.

Submitted by Survey Panel Chairman
28 February 2009

Permanent Secretariat notes (April 2009):

1. The amended URs were approved by GPG on 18 March 2009 (ref. 7718bIGd).
2. During the typesetting process it was noted that para 5.1.5 of UR 7.2 was inconsistent with the amended URs and so following consultation with the Survey Panel this was also amended at this time.
3. Regarding the implementation date, GPG agreed to use 1st July 2010 provided that it was consistently used for the amended URs.

Technical Background document for UR Z10.1 Rev.17 (Feb 2010)

1. Scope and objectives
To amend UR Z10.1 (Rev.16) for the harmonization with currently revised MARPOL Annex I.

2. Engineering background for technical basis and rationale
-

3. Source / derivation of the proposed IACS Resolution
- MARPOL 73/78
- IACS UR Z10.1 (Rev.16)

4. Summary of Changes intended for the revised Resolution:
As MARPOL I was revised, the reference to MARPOL I/13 (3) in paragraph 1.2.2bis should read MARPOL I/18(3).

5. Points of discussions or possible discussions
None

6. Attachments if any
N/A

Technical Background for UR Z10.1 Rev.18 (Mar 2011)

1. Scope and objectives

1) To amend UR Z10.1 to harmonize the definition of transverse section.

2) Update of references in the Executive Hull Summary Table IX.

2. Engineering background for technical basis and rationale

1) Based on that fact that bulk carriers and oil tankers have a transverse framing system applied for example on ship's sides etc. and that UR Z7 is applied to all types of ships and includes an extended definition of transverse section it is necessary to unify this definition in UR Z10s.

2) Update of references in the Executive Hull Summary Table IX such that the introduction of extended annual surveys is noted in the 'Memoranda' section rather than under 'Conditions of Class'.

3. Source / derivation of the proposed IACS Resolution

IACS UR Z7.

4. Summary of Changes intended for the revised Resolution:

1) The following additional text is added to the definition of transverse section in para 1.2.5:

"For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections."

2) In the Executive Hull Summary Table IX (iv) the reference to part H) is updated to part I) as per Table IX (ii).

5. Points of discussions or possible discussions

None.

6. Attachments if any

None.

Technical Background for UR Z10.1 Rev.19, July 2011

1. Scope and objectives

Review the requirement for repairs within IACS UR 7 and UR 10 series, in particular the requirement for Prompt and Thorough Repair, with a view to developing wording that would permit a temporary repair and the imposition of a Recommendation/ Condition of Class under specific and controlled circumstances, and in accordance with PR35.

2. Engineering background for technical basis and rationale

There are instances, for example a localised, isolated and very minor hole in a cross-deck strip, at which a suitable temporary repair, for example by welding or doubling, and the imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date, are considered very adequate methodology for dealing with the defect.

Current IACS Requirements in the UR Z7 and Z10 series, for Prompt and Thorough repair, would not permit this to be an option, the defect would have to be permanently Promptly and Thoroughly repaired, which might require removing cargo, moving to a repair berth and staging inner spaces.

Under the Requirements of IACS Procedural Requirement PR 35 the methodology of Temporary Repair and imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date is fully permissible.

3. Source / derivation of the proposed IACS Resolution

Based upon discussion within the IACS Survey Panel.

4. Summary of Changes intended for the revised Resolution:

Following the definition of Prompt and Thorough Repair in the Unified Requirement, a new paragraph is proposed to be added:-

"1.3.3 Where the damage found on structure mentioned in Para. 1.3.1 is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the surveyor to allow an appropriate temporary repair to restore watertight or weather tight integrity and impose a Recommendation/Condition of Class in accordance with IACS PR 35, with a specific time limit."

5. Points of discussions or possible discussions

a) The points of discussion are as indicated in Sections 2 and 4 above.

b) Discussion took place on whether to prepare this amendment as a Unified Interpretation of IMO Resolution A.744(18)/UR Z7 and Z10 series, finally it was agreed to make direct amendment to the relevant URs.

c) It is proposed that this amendment be submitted directly to the IMO DE/MSC Committees for consideration of amending directly IMO Res. A744(18)

6. Attachments if any

None

Technical Background for UR Z10.1 Rev.21, Jan 2014

1. Scope and objectives

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.
b) To align the requirements in PR37 and UR Z10s regarding safe entry to confined spaces.

2. Engineering background for technical basis and rationale

a) As per the IMO Res. A1053 (27), lengthy conversions (not necessarily of major character) or other major repair work can be assigned for a 5 year period from the date of completion of conversion/repairs/surveys.
b) Safety requirements in IACS PR37 can be applied to carry out survey in safe way for all kind of ships. When there are no indications about the safety of surveyor in UR Z10s then the requirements in PR37 shall be applied.

3. Source / derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

a) Following additional text was included to section 2.1.3 to clarify the class period for lengthy conversions

"In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date."

b) Existing Section 5.2.6 and 5.2.7 were deleted from UR Z10s since provisions of these sections were covered by PR37. Reference of PR37 was included in Section 5.2.1.1.

5. Points of discussions or possible discussions

i) Additional text to Para.2.1.3was discussed in order to clarify class period.
ii) Panel considered that safety of surveyors should be dealt by PR37.

6. Attachments if any

None

UR Z10.2 "Hull Surveys of Bulk Carriers"

Summary

This revision is to harmonize the revised requirements in line with the amendments made to ESP Code vide Res.MSC.525(106)

Part A. Revision History

Version no.	Approval date	Implementation date when applicable

**** Notes:***

1. *Changes introduced in Rev.23 are to be uniformly implemented for surveys commenced on or after 1 January 2008, whereas statutory requirements of IMO Res. MSC 197(80) apply on 1 January 2007.*

2. *The amendments to Table I and 4.2.3 introduced in Rev.12 are to further increase the requirements for close-up survey at Special Survey No.2 and to require the scope of the Intermediate Survey thereafter to have the scope of Special Survey No.2. These requirements are to be implemented for any Special Survey No.2 or the Intermediate Survey subsequent to Special Survey No.2 commenced after 1 January 2003.*
   Paragraph 4.2.4.3 is newly introduced in Rev.12 in accordance with Res.MSC 105(73) and is to be implemented from 1 July 2002.
   The other changes introduced in Rev.12 are to be implemented within one year of the adoption by Council.
3. *The changes to section 6 introduced in Rev.30 are to be uniformly applied by IACS Societies for surveys commenced on or after 1 July 2016.*
   The other changes introduced in Rev.30 are to be uniformly applied by IACS Societies for surveys commenced on or after 1 July 2014.

- **Rev. 37 (Feb 2023)**

1 Origin of Change:

- Suggestion by an IACS member
- Based on IMO Regulation

2 Main Reason for Change:

To revise the definition of Ballast tank from use of 'solely' carriage of salt water to 'primarily' use in line with other IACS URs and ESP Code.

To revise the criteria for annual examination of ballast tanks from POOR condition to condition less than GOOD in line with the amendments made to ESP Code vide Res.MSC.525(106).

To refine the wording of ballast tanks examination requirements at annual surveys in line with the amendments made to ESP Code vide Res.MSC.525(106).

To revise a reference changed to IACS Recommendation in line with other IACS URs and the amendments made to ESP Code vide Res.MSC.525(106).

3 List of non-IACS Member classification societies contributing and/or participating in IACS Working Group:

None

4 History of Decisions Made:

- One survey panel member pointed out the definition of ballast tank in UR 10s are different from other URs like UR7/7.1/7.2 and the ESP Code, so panel decided to modify the wording 'solely' to 'primarily'. (PSU20004)

- Due to the marine casualty of M/V"STELLAR DAISY", enhancement of ballast tank examination for bulk carriers, that increase the criteria of annual examination from 'POOR' condition to the condition less than 'GOOD', was submitted to SDC8. Although IACS has objected to the view and submitted commenting papers continuously, the proposal was agreed at SDC8 and published as Res.MSC.525(106).

- One survey panel member suggested to refine the wording 'extended annual/intermediate survey' to 'examination of ballast tanks at annual surveys' in Executive Hull Summary and panel decided to modify it in the ESP Code first. It was submitted to SDC8 and included in Res.MSC.525(106). (PSU18056)

- One survey panel member pointed out that the references in UR Z10s need to updated (referred documents have been changed to IACS Recommendations) and deleted to be in line with other UR Z10s. And panel decided to delete the reference of itself in UR Z10.2 in line with the amendments made to ESP Code vide Res.MSC.525(106). (PSU19057)

No TB is expected for the present revision.

5 Other Resolutions Changes:

Unified Requirements: Z10.2, Z10.4 and Z10.5

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal:	28 January 2020	(PSU20004)
	24 October 2017	(PSU18056)
	18 December 2019	(PSU19057)
Panel Approval:	12 October 2021	(PSU21026_ISUf)
GPG Approval:	08 February 2023	(22198_IGd)

Rev. 36 (May 2019)

.1 Origin of Change:

- o Suggestion by an IACS member

.2 Main Reason for Change:

This revision is to address the policy decision made by GPG using the common terminology 'Condition of Class' (CoC) instead of the terms 'Recommendation/ Condition of Class' based on the outcome of III 5.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

During the 29th panel meeting, the panel discussed about the comments of members, and concurred with the view to retain the present definitions of CoC in the IACS resolutions with the wording 'Recommendation' to be removed. The panel also agreed to use the term 'Statutory Condition' for the 'recommendation' of the statutory certificates in IACS resolutions and RECs, and when discussing the proposal of a member to consider the harmonization of the terms of 'recommendation' and 'condition of class' in RO Code, the panel unanimously agreed to take no action on the IMO instruments, leaving the relevant actions to be decided by the relevant IMO bodies when IACS feeds back to IMO the IACS action on the harmonization of the two terms.

Panel members concurred with the view that it is not necessary to develop a new procedure requirement, and agreed to set the implementation date of these IACS resolutions (other than RECs) as 1st July 2020.

Before the implementation date of 1st July 2020 for using the common terminology 'Condition of Class' only, 'Recommendations' and 'Condition of Class' are to be read as being different terms used by Societies for the same thing, i.e. requirements to the effect that specific measures, repairs, surveys etc. are to be carried out within a specific time limit in order to retain Classification.

No TB is expected for the present revision.

.5 Other Resolutions Changes:

The following IACS resolutions and Recommendations (RECs) were agreed to be revised:

- Procedural Requirements: PR1A, PR1B, PR1C, PR1D, PR1 Annex, PR3, PR12, PR20, PR35 and the attachment of PR16;
- Unified Requirements: Z7, Z7.1, Z7.2, Z10.1, Z10.2, Z10.3, Z10.4, Z10.5, Z15 and Z20
- Unified Interpretations: GC13
- Recommendations: Rec.41, Rec.75, Rec.96, Rec.98

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal: 14 January 2019 tasked by GPG (17044bIGm)
Panel Approval: 22 March 2019 (PSU19010)
GPG Approval: 30 May 2019 (17044bIGu)

- **Rev.35 (Jan 2018)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reasons for Change:

In order to introduce new provisions into the ESP Code which were found among the ESP Code and relevant URZ10s, a series of items of UR Z10s shall be amended accordingly with ESP Code.

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Panel members discussed this issue under PSU17018: updating the CSR reference for both HCSR and CSR for Bulk Carriers; figures 6 in paragraph 7.3 and figure 4 in paragraph 4.3 of Annex V were to be replaced with new accurate figures; Item 31 in sheet 12 of Annex 2 was to be deleted and renumbered other items as well; The item 1 in Notes to TM6-BC of Annex 2 was to be replaced with correct text; The paragraphs 3.2.1.1, 3.2.3.4 and 3.2.3.6 were to be revised for consisting with ESP Code; "Thickness measurement company" was to be replaced with "Thickness measurement firm" throughout the UR; etc.

During the 26th Survey Panel Meeting, the Panel discussed the divergence and reached agreements with the revisions.

No TB is expected for the present revision.

.5 Other Resolutions Changes

UR Z10.1, UR Z10.3, UR Z10.4, UR Z10.5

.6 Dates:

Original Proposal: 22 October 2016 by a Survey Panel Member
Panel Approval: 24 December 2017 by Survey Panel (Ref: PSU17018)
GPG Approval: 15 January 2018 (Ref:17189_IGc)

- **Rev.34 (Sep 2017)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reasons for Change:

To introduce the criteria for the steel renewal which belongs under the unified requirements of series S and are related to the net scantling approach.

To introduce the method for close-up surveys of the cargo hold shell frames of bulk carriers 100,000 dwt and above.

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

A member noted that some Unified Requirements of series S (Strength of Ships), such as UR S18, contain criteria addressing the steel renewal for dedicated structures such as transverse bulkheads, cargo hatch coamings and plating. These criteria (based on the net scantling approach) are applicable also to units designed with the gross scantling approach because they refer to particular structures for which it is foresaw the dimensioning (or the design verification) according to the net scantling approach.

During the 24th Survey Panel Meeting the members agreed to review all UR of the S series in order to identify those containing any steel renewal criteria with the scope to review them.

Having found that UR S18, UR S19 and UR S21 contain steel renewal criteria that need to be taken in to account during the thickness measurements review process, the members agreed that a new paragraph dealing with this issue needed to be added under section 8 of UR Z10.2.

The paragraph 8.1.2, "Thickness measurements Acceptance Criteria", has been agreed and inserted in the present revision of UR Z10.2.

A Member proposed the modification of paragraph 5.3.4 of the UR Z10.2 in order to include in the list of the means of access to the upper part of the cargo hold side shell frames, of bulk carrier having DWT equal or more 100000, also the use of the cherry picker by taking in account that the maximum allowed working height should not be more than 17 m (according to the provisions set in IACS Recommendation 136).

Members reviewed the history file related to UR Z10.2 and found that the prohibition of the use of cherry pickers (hydraulic arms and similar equipment) on board of ships, having DWT equal or more 100000, was knowingly decided by the Panel following to an incident occurred to the ship CAPE AFRICA. Members discussed the issue during the 23rd meeting and concurred that in order to modify the UR Z10.2 it need a solid background which may counterweighted the negative issue of the CAPE AFRICA. So Members agreed to prepare a questionnaire to distribute to the qualified and experienced (on ESP bulk carriers) surveyors of each classification Society. The aim of the questionnaire is to build a solid background based on the interview to the personnel which daily operates on board.

The questionnaire was sent to each Society on May 2016 and 413 replies received. Members used the result of the consultation to decide whether the paragraph 5.3.4 of the UR Z10.2 might be modified according to the proposal.

The paragraph 5.3.4" The use of hydraulic arm vehicles or aerial lifts ("Cherry picker")" has been agreed and inserted in the present revision of Z10.2.

No TB is expected for the present revision.

.5 Other Resolutions Changes

UR Z7, UR Z7.1, UR Z10.5

.6 Dates:

Original Proposal:	01 July 2016 Made by a Survey Panel Member 09 September 2016 (24th Survey Panel meeting) Made by a Survey Panel Member
Panel Approval:	25 August 2017 (Ref: PSU16044 and PSU16002)
GPG Approval:	26 September 2017 (Ref: 17107aIGb)

• Rev.33 (Nov 2016)

.1 Origin of Change:

☑ Suggestion by IACS members

.2 Main Reasons for Change:

To address the Observation 04, raised by the IMO Auditing Team 5 of the IACS common package 1 in respect to the functional requirements (FR) 9-15.

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Based upon a GPG Member's proposal, the Panel examined, under the task PSU16017, the possible modification of the UR Z10.2 in order to include the verification of the Ship Construction File (SCF) during the class periodical surveys for those ships subjected to the requirements of SOLAS reg. II-1/3-10.
The suggested text was discussed by the Members and it was agreed that since the issue might be regarded as a proactive extension of the corrective action to OBS 04 this should be inserted under paragraph 6.4.2 of UR Z10.2.
Members reviewed the proposed text together with the relevant proposals of its modification; during the 24th Survey Panel meeting agreed to add the new paragraphs 6.4.2.1 and 6.4.2.2 dealing with the verifications of the Ship Construction File to be performed during the periodical surveys.

No technical background is expected for this revision.

.5 Other Resolutions Changes

The amendment affects UR Z10.4 and UR Z 10.5.

.6 Dates:

Panel Approval: 09 September 2016 - 24th Survey Panel Meeting
GPG Approval: 22 November 2016 (Ref: 16077_IGd)

- **Rev.32 (Feb 2015)**

.1 Origin of Change:

☑ Suggestion by IACS members

.2 Main Reasons for Change:

a) To consider appropriate text in IACS document regarding the applicability of the Thickness Measurements when the Close up survey is performed.
b) To consider the impracticability of the internal structure close up inspection of cargo hold hatch covers which have no access structurally (from the approved design) and it is possible to survey and gauge plating only.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) Following an ACB query an IACS member proposed to add suitable text in appropriate IACS documents regarding the application of the Thickness Measurements when the close up surveys are performed as survey requirement due at the Intermediate/ Renewal Class surveys. This Member expressed the view that the requirements to execute the Thickness Measurements of the area subject to Close Up Surveys are expected into the table relevant to "MINIMUM REQUIREMENTS FOR THICKNESS MEASUREMENTS AT SPECIAL SURVEY ………" while the paragraph 1.4 of the document contains only the requirement that "Thickness Measurements of the areas subject to close up surveys shall be taken in conjunction with the close up survey".

Panel discussed the matter under item PSU13051 and considered that wordings of Para 1.4 of current UR Z7s/10s need to be revised in order to clarify this issue; finally Panel agreed to add additional wording to Para.1.4.

b) Panel, following the proposal submitted by a Member, concurred and agreed that in case the cargo hold hatch covers have a configuration that does not permit the ingress of the surveyor for the internal inspection (e.g. box type panel), the close up survey should be limited to external parts as well as the Thickness Measurements that should be performed only on the external plating. The technical background, on which is based the modification of the requirement, is that the internal structure of a hatch cover of box type construction are reasonably not subject to any corrosion phenomenon. Hence, unless the external plating of the box is damaged, no depletion of the internal structures is expectable.

Panel discussed the matter under item PSU13051 and considered that an explanation note to Para 2.2.4.1 and to Table 1 of current UR Z10.2 need to be added to clarify this issue.

.5 Other Resolutions Changes

The amendment a) affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.3, UR Z10.4 and UR Z 10.5.

The amendment b) affects also UR Z 7.1 and UR Z 10.5.

.6 Dates:

Panel Approval: Amendment a) at 19th Survey Panel Meeting (6 March 2014)
Amendment b) by correspondence under PSU 13051
GPG Approval: 05 February 2015 (Ref: 14193_IGc)

- **Rev.31 (Jan 2014)**

.1 Origin of Change:

☑ Suggestion by IACS members
☑ Suggestion by GPG

.2 Main Reason for Change:

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.

b) To align the difference between PR37 and URZ's regarding safe entry to confined spaces.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) With reference to IMO Res. A1053 (27) (5.5 Application of "special circumstances") an IACS member proposed to add suitable text in appropriate IACS document regarding class period for lengthy conversions. This Member expressed that when a renewal survey has been completed, the new 5 year class period would normally be calculated from the expiry of previous class period/class certificate and in some cases this might result in unreasonably short time from one renewal survey completion until the next renewal would be due.

   Panel discussed and considered that wordings of Para 2.1.3 of current UR Z7s/10s (second sentence) could address this issue but finally agreed to add additional text to Para 2.1.3 in order to clarify this matter. (PSU13024)

Panel discussed to clarify the survey requirements in PR37 and URZ's regarding safe entry to confined spaces. Panel considered that the safety issues of surveyor should be dealt by PR37. At 18th Panel meeting, Panel concluded to delete requirements from UR Z10s which were already covered by the PR37. (PSU13032)

.5 Other Resolutions Changes

a) The identical amendment affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.3, UR Z10.4 and UR Z 10.5.
b) The identical amendment affects UR Z10.1, UR Z10.3, UR Z10.4 and UR Z 10.5.

.6 Dates:

Panel Approval: 7 November 2013 by Survey Panel
GPG Approval: 14 January 2014 (Ref: 12011aIGd)

- **Rev.30 (June 2013)**

.1 Origin of Change:

☑ Suggestion by an IACS Member
☑ Suggestion by GPG in response to the request of EG/SoS
☑ Suggestion by EG/GBS in response to GPG Chairman's request in 10060fIGg.

.2 Main Reason for Change:

a) An inquiry from a member whether the 'Other equivalent means' referred in Para 5.3.2 of IACS UR Z10.2 include the use of Cherry Pickers for survey of other structures. (PSU 12022)
b) To introduce provision in UR Z10s that Rescue and emergency response equipment must be suitable for the configuration of the space being surveyed including the size of the access points.(PSU 12032, GPG 12138_)
c) In order to comply with the IMO Goal Based Standard (GBS), it is required to update the Ship Construction File (SCF) throughout the ship's service life. Therefore, procedures for updating SCF have been added in UR Z10s.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) Discussion of this matter initiated by a Panel member regarding the use of Cherry Pickers in Cargo Holds with reference of IACS URZ10.2. In accordance with UI SC191 and Rec 91, the Cherry Picker is allowed up to 17m height for Cargo Hold structure (ships constructed after 2006 for Alternative means of access). As per the provisions of URZ10.2, Cherry pickers are allowed for survey of side shell frames only.

   Panel discussed and considered that Para 5.3.2 of UR Z10.2 allows the use of Cherry Pickers as 'Other equivalent means'. Accordingly, Panel agreed to clarify this matter by including text “hydraulic arm vehicles such as conventional cherry pickers” to UR Z10s and UR Z7s for a ship not subject to the above 17m restriction.

b) GPG Chairman requested to consider the suggestion of EG/SoS to clarify the wording in UR Z 10.1 – 10.5 to make it compliance with draft PR37 submitted by EG/SoS.

   The Survey Panel discussed this matter and introduced a new (sub-)section 5.5 “Rescue and emergency response equipment” in line with the suggestion of EG/SOS.

c) At the time of reviewing the revised UR Z23 which is followed only for new construction, PT/GBS proposed that URZ10s should have provisions for updating Ship Construction File (SCF) since it would be maintained throughout the ship’s service life.

   Survey Panel at its 17th meeting discussed the proposals of PT/GBS for the revision of UR Z10s in order to comply the IMO GBS requirements for existing vessels. Panel agreed to add new text in URZ10.2 for updating and monitoring the SCF.

.5 Other Resolutions Changes

a) The identical amendment affects UR Z7, UR Z7.1, UR Z10.1, UR Z10.3, UR Z10.4 and UR Z 10.5.
b) The identical amendment affects UR Z10.1, UR Z10.3, UR Z10.4 and UR Z 10.5.
c) The identical amendment affects UR Z10.4 and UR Z10.5.

.6 Dates:

Survey Panel Approval: 7 March 2013 (17th Survey Panel meeting)
GPG Approval: 22 May 2013 (Ref: 9640_IGn) & 05 June 2013 (Ref: 10060fIGn)

- **Rev.29 (July 2011)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reason for Change:

Following external audit a member was advised that a small temporary doubler on a cross-deck strip of a bulk carrier should have been promptly and thoroughly repaired at the time of survey. The member carried out an investigation and found that the actions of the surveyor were fully justifiable, the temporary repair and short term Condition of Class imposed were an appropriate method of dealing with such a situation. The member advised that the current requirements for 'Prompt and Thorough Repair' stipulated under the UR 7 and UR 10 series do not give any leeway for carrying out temporary repairs (and imposing a Recommendation/Condition of Class in accordance PR 35) where the damage in question is isolated and localised, and in which the ship's structural integrity is not impaired.

The Survey Panel discussed the matter and agreed that under carefully defined circumstances a temporary repair and short term Recommendation/Condition of Class would be an appropriate course of action.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

The matter was discussed by correspondence within the Survey Panel and at the Autumn 2010 Panel Meeting. Following discussion at which the possibility of a Unified Interpretation being raised was considered, it was eventually decided to make direct amendment to the relevant Unified Requirements.

The wording of the new paragraph to be inserted as Para 1.3.3 in all relevant Unified Requirements was extensively discussed prior to agreement.

The proposal was unanimously agreed by Survey Panel Members.

.5 Other Resolutions Changes

The identical amendment affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.2, UR Z10.3, UR Z10.4 and UR Z 10.5.

.6 Dates:

Original Proposal: *September 2010 Made by a Member*
Panel Approval: *March 2011*
GPG Approval: *27 July 2011 (Ref: 11118_IGb)*

- **Rev.28 (Mar 2011)**

.1 Origin for Change:

☑ Suggestion by IACS member

.2 Main Reason for Change:

1) Inconsistency of the definition of transverse section of the ship given in UR Z7 and UR Z10s.

2) Update of references in the Executive Hull Summary Table VII.

3) Correction of "minimum allowable diminution" to "maximum allowable diminution" in Annex II.

4) To make the survey requirements in UR Z10.2 compatible with the new requirements contained in CSRs.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None.

.4 History of Decisions Made:

Item 1) was proposed by RS and item 2) and 3) were proposed by GL. All amendments were agreed by the panel.

Regarding Item 4) The Survey Panel Members decided that the task would be carried out by a Project Team, rather than through correspondence within the Panel. The PT was composed by three Members from the Survey Panel and one Member, external to the Panel, who was expert both in surveys and in structural matters. Subsequently the PT requested the Small Group on Strategy & Steering Committee that the PT were enlarged with the joining of two additional Members of the Hull Panel, in order to increase the PT's expertise in the CSRs based on the fact that CSRs would be amended, even if limitedly to requirements related to surveys after construction. The Small Group on Strategy & Steering Committee fulfilled the PT request.

Additionally Permsec had received feedback from one of the IACS Audit Managers that the 20% and 25% pitting intensity diagrams were missing from Figure 2 of Annex V. Investigation showed that this appears to have been a typographical error introduced around 2005 and so Permsec have reinstated the missing diagrams.

.5 Other Resolutions Changes

UR Z10.1, Z10.3, Z10.4 and Z10.5.

.6 Dates:

Technical Background Document

UR Z10.2 – Revision 10
For ExCM decisions

Objective and Scope:

Revise UR Z10.2 to introduce ExCM (Extraordinary Council Meeting in Feb 2000) decision to UR Z10's

- ExCM FUA 2-2: Intermediate surveys of ships subject to ESP, which are over 15 years of age, will be enhanced to the scope of the preceding special survey with dry docking or under water survey as applicable.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC Chairman, shortly after GPG 48th meeting:

- The para. 4.2.2, 4.2.3 & 4.2.4 for ExCM FUA 2-2.
- For the outcome of WP/SRC Task 49 "application of Z10.2 to ore carriers), the para. 4.2 was re-arranged.
- The paragraph 8.2.1 for compatibility with the PR 19 (ABS GPG suggested.)
-

Points of Discussion:

GPG 48 meeting discussed whether to extend the requirement of ExCM FUA 2-1 to other ships and C 41 confirmed not to extend this requirement to other ships for the time being.

- **-** ExCM FUA 2-1: All ballast tanks adjacent to cargo tanks with heating coils shall be examined internally on an annual basis after the ship has reached 15 years of age.

Unresolved Comments:

-

Discussions:

In addition, LR (GPG) proposed the following additions:

- The second half of the para. 4.2.4.1(LR)

  "except that testing of cargo and ballast tanks is not required unless deemed necessary by the attending surveyor."

  The majority GPG agreed.

- The paragraph 7.1.1 of Z10.1 and Z10.3, paragraph 8.1.2 of Z10.3 were revised for their compatibility with the PR 19 "PR for Thickness Measurement".

Submitted by the Permsec
On 18 Sept 2000

Technical Background Document
WP/SRC Task 49
UR Z10.2 – Proposed Draft Revision 10
(submitted by WP/SRC Chair on 10 June 2000)

Objective and Scope:

Review UR Z10.2 for the purpose of verifying that it also fully applies to Ore Carriers as defined in UR Z11.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC Members, through correspondence and their meeting, identifying the requirements contained in Z 10.1 for Oil/Ore Carriers and incorporating them into UR Z10.2.

Points of Discussion:

WP/SRC did not unanimously agreed to either of two draft UR's submitted with this document.(Z102.doc and Z102strict.doc)

Unresolved Comments:

WP/SRC agree to the changes in 4.2.1.1 and 4.2.2.5 with the exception of the requirement for close-up survey of Web Frame Rings in Ballast Wing Tanks for vessels ≥ 15 years of age.

Seven of the Members agreed to require that All Web Frame Rings in All Ballast Wing Tanks should be close-up surveyed.

Three of the Members did not agree, but did agree to require All Web Frame Rings in One (1) Ballast Wing Tank and One (1) Web Frame Wing in all remaining Ballast Wing Tanks be close-up surveyed.

Discussions:

The Members that did agree to require that All Web Frame Rings in All Ballast Wing Tanks should be close-up surveyed, based the decision to remain consistent with the principal adopted in Z10.1 for Oil Tankers and Oil/Ore Carriers. LR and DNV were vocal in their opposition to the less strict requirements supported by BV, RINA, and KR.

The Chairman requested reasons for the opposition to the stricter requirements from the three Members for inclusion in this document and are as follows:

BV - When the ships in caption have 5 ballast tanks each side that means in that case they have 10 ballast tanks in total + peaks. considering 4 web rings per tanks gives in 40 web rings. If the ship's depth is 18 m and tanks' breath 10 m the developed length of a web ring is 56 m considering the 40 web rings we will have to close-up examine 56x40= 2240m. considering the scaffoldings to be erected, the physical condition requested to the attending Surveyor(s) and the other items to be inspected, it will be simply impossible to comply with the requirements (which will correspond more or less to a Special Survey) during an intermediate survey. Unless we reduce the class term to 3 years, I do not agree with the proposals.

RINA - RINA is of the opinion that requiring the close-up survey of all web frame rings in all ballast tanks (wing tanks + peak tanks) at the intermediate survey of ore carriers of 15 years of age and over is excessive and not reasonable as the assessment of these tanks can be achieved likewise through the overall survey in all of them and the close-up survey of "ALL web frame rings in ONE ballast wing tank and ONE web frame ring in EACH REMAINING ballast wing tank" and, in any case, should the condition of the web frame rings inspected be found not satisfactory, the survey will have to be extended to other rings in the same tank, as suggested in my message of 15 April. This less strict scope of survey would allow intermediate survey to be feasible and compatible with the commercial operations of ships (in fact these surveys are usually carried out either during loading and unloading phases or at the end of them and require extensive scaffolding to be erected or rafting to be carried out). In addition, experience in performing intermediate surveys of ore/oil carriers for which the same stricter requirements have already been implemented has proved how it is difficult for a surveyor to have these spaces adequately prepared for this kind of inspection. Thus we do not like to extend the same problem to other kinds of ships and, rather, would like to amend the corresponding requirements related to ore/oil carriers accordingly, although it is recognized that this proposal could be difficult to achieve. Anyhow, even if the majority decides to submit the original text to GPG, we are prepared to maintain our position.

KR - The requirements of close-up survey of "all web frame rings in all salt water wing ballast tanks" at intermediate survey for ships older than 15 years is considered too heavy because all transverse webs in each ballast tank were close-up surveyed already at special survey No.3 as indicated in table 1 of existing UR Z10.2.

Note of IACS Permanent Secretariat (Date: 19 July 2000)

1. Numbering of the paragraph 4.2 of Z10.2 was re-arranged due to introduction of the requirements addressing ExCM FUA 2-2 “enhancement of intermediate survey to the preceding special survey for ships over 15 years of age.

2. The WP/SRC’s proposed change to the para. 4.2.2.5 (now it stands as para. 4.2.3.1.b)) invited diverging views among GPG Members. However, it was found at GPG 48 meeting in March 2000 that the ExCM decision relating to enhancement of intermediate survey should be taken into account and as a result an urgent task was given to WP/SRC Chairman during GPG 48 to re-draft this paragraph.

   (The para. 4.2.2.5 (now 4.2.3.1.b): the extent of close-up survey of ballast tanks at intermediate survey in ore carriers over 15 years of age.)

3. WP/SRC Chairman put forward a re-draft of this requirement in April 2000.

4. GPG Chairman announced unanimous agreement on 14 August 2000 (0065aIGd, 14/8/00).

Technical Background Document
WP/SRC Task 62
UR Z10.2 – Proposed Draft Revision 10
(submitted by WP/SRC Chair on 10 June 2000)

Objective and Scope:

Revise UR Z10.2 detailing how intermediate surveys are to be applied annually to the foremost cargo holds of ships subject to SOLAS XII/9.1. Also, draft comparable amendments to A.744(18) for consideration by GPG with a view to their submission to IMO.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC members through correspondence and their meeting by incorporating the requirements of SOLAS XII/9.1 into UR Z10.2 and A.744(18).

Points of Discussion:

WP/SRC unanimously agreed to the draft UR.

(Note: After adoption of Z10.2 (Rev.10), amendment was made to it in order to avoid conflict between WP/SRC Task 62 and ExCM decision to extend the scope of intermediate survey of older bulkers to that of special survey. See the Rev. 10.1 of Z 10.2 (3 October 2000, note by the Permsec))

Submitted by the Permsec
On 18 Sept 2000

Technical Background Document

UR Z10.2 – Revision 10.1
For WP/SRC Task No. 62

Objective and Scope:

Revise UR Z10.2 (Rev.10) to keep the original intention that for the foremost cargo hold of the ships subject to SOLAS XII/9.1, intermediate surveys shall apply.

Source of Proposed Requirements:

- The outcome of WP/SRC Task 62.

Points of Discussion:

The consequence of Council's decision to extend the scope of intermediate surveys of older bulkers to that of special survey has the effect of making the annual survey required by 3.2.1.2 be a special survey (i.e. a full special hull survey every year for bulk carriers subject to SOLAS XII/9.1).

See the note 5, para. 3.3 and new Annex IV.

Unresolved Comments:

\- - - - -

Submitted by the Permsec
On 3 Oct 2000

Technical Background Document
WP/SRC Task 77
UR Z7 – Proposed Draft Revision 7
(Including Rev.8 of Z10.1, Rev.11 of Z10.2, Rev.4 of Z10.3)

Objective and Scope:

Extend the requirements for permanent repairs at the time of survey in UR Z 10.2 to all ships.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC members through correspondence and discussions at the September 2000 meeting.

Points of Discussion:

UR Z7 was amended to apply “prompt and thorough” repairs to all vessels. The new wording defines a prompt and thorough repair to be a repair as a result of wastage and not an incident such as contact damage where a temporary repair or deferral of repairs could be permitted. This wording is more explicit than the wording in UR Z10.2 and should achieve a uniform application among the Members.

WP/SRC also agreed to include these requirements in Z10.1, Z10.2 and Z10.3 in order to not effect A.744(18).

WP/SRC unanimously agreed to the draft UR.

Note by Permsec

GPG 49 (11-13 Oct. 2000) agreed that the same changes be introduced to Z10’s and carried out editorial review of Z 10’s.

Technical Background for

Rev.8.1, Z10.1

Rev.11.1, Z10.2

Rev.4.1, Z10.3

(21 June 2001)

1. Scope of objectives

Revise section 2.3.1 for clarity.

2. Points of discussions or possible discussions

- BV GPG member proposed to revise section 2.3.1 of Z10s on 12 June 2001 (0065j)

- IACS Council considered the ambiguity of the sentence in Special Survey section 2.3.1 “For Fuel Oil Tanks the necessity for the Overall Survey is to be determined based on the ship’s age” in the context of its application at intermediate surveys on ships over 15 years. Council agreed that the overall survey of low corrosion risk tanks such as fuel oil, lube oil and fresh water tanks could be subject to special consideration as already addressed in section 2.2.5 of UR Z7 and therefore amended the first sentence of 2.3.1, accordingly, and deleted the last sentence of 2.3.1.

- Adopted on 21 June 2001.

* * * * *

Technical Background Document
WP/SRC Task 87
Amend Z10.1&10.2 to reflect changes introduced to Res A.744 by MSC 73
(Z10.1, Rev.9) + (Z10.2, Rev.12) + (Z10.3, Rev.5)

Objective and Scope:

To harmonise IACS UR Z10.1 and Z10.2 with IMO Res A744(18), as previously amended and as amended by IMO MSC105(73) and MSC 108(73).
These amendments enter into force 1 July 2002.
It was assumed by WP/SRC that the intention of GPG has been to revise UR Z10.3 (chemical tankers) as well with respect to the intermediate dry-docking requirement, but not to include the requirement to evaluation of longitudinal strength.
In addition, the relevant changes to UR Z10.1 based on the changes introduced in IMO Res A744(18) as reported in MSC 74/24/Add1-Annex 17 have been included. These were based on IACS submission DE 44/13/1. These amendments will enter into force 1 January 2004 subject to IMO tacit acceptance procedures.

POINTS OF DISCUSSION:

The Chairman of WP/SRC would further draw GPG's attention to paragraph 4.2.4.3, which contains the requirement to intermediate dry-docking for oil tankers exceeding 15 years of age. The corresponding Res.A 744(18) requirement (paragraph 2.2.2) does not link the dry-docking to the intermediate survey. This issue was discussed extensively by correspondence and during three WP meetings this year. A consensus decision was achieved without reservations from any members. This process was time consuming, hence the delay in submitting this document to GPG for approval. However, at the annual meeting of the WP in October 2001 all members agreed that we should not accept the wording of Res. A 744(18) paragraph 2.2.2, but instead require that the intermediate dry-docking is to be linked to the intermediate survey and include a requirement to carry out surveys and thickness measurements of the lower portions of the tanks for oil tankers. (similarly, cargo holds/water ballast tanks for bulk carriers)

GPG is advised to note that the proposed requirement in paragraph 4.2.4.3 may result in a third dry-docking within the 5-year period of the classification certificate in case that a dry-docking is carried out prior to the window for intermediate survey.

The Chairman of WP/SRC suggests that GPG approves UR Z10.1 with high priority and allows PermSec in the meantime to start the work to amend and typeset UR Z10.2 and URZ10.3 with respect to the intermediate dry-docking requirement, as well as introducing the appropriate changes to UR Z10.2 and UR Z10.3 with respect to MSC 74/24/Add 1-Annex 17.

Note:

1. GPG tasked WP/SRC to review dry-docking survey requirements in Z10.2-4 and Z3 to harmonize them with those in Z10.1 (Rev.9) and reflect in Z3 the interim application of bottom survey requirements as introduced in MSC/Circ. 1013 (Res A.746(18)).

   Task 101, Target 2Q-2002

2. GPG confirmed (s/n 1060c) that 7.1.3 of A.744(MSC 74/12/Add.1/Annex 17/page 6), as quoted below, should not be included in Z10s.

   "7.1.3 Thickness measurements are to be carried out within 12 months prior to completion of the periodical survey or of the intermediate survey."

   Reason: The above sentence will restrict the 15 month and 18 month survey window for TM during the intermediate and special surveys respectively.

3. GPG confirmed that 7.1.4 of A.744(MSC 74/12/Add.1/Annex 17/page 6), as quoted below, should not be included in Z10s:

   "7.1.4 In all cases the extend of the thickness measurements should be sufficient as to represent the actual average condition."

   Reason: No compelling need, in view of MSC 74/12/Add.1 being adopted by MSC 75(May 02). IACS will live with this not harmonized sentence.

4. For IACS Council decisions to improve bulk carrier safety, see the TB for Revision 12 of Z10.2.

Submitted by WP/SRC Chairman

UR Z10.1(Rev.11) and Z10.2(Rev.14)

(July 2003)

Technical background

Part A: Survey Reporting Principles

1. Objective

WP/SRC Task 80 – Survey Reporting Principles

2. Points of discussion

The WP/SRC carried out this task according to the work specification of Form A (Rev.1) and reported the outcome on 18 December 2002 as follows:

- Review of NMD's report on "Sinking of Leros Strength", dated 6 July 2000 and the recommendations in section 5.3
- Review of IACS Council's reply, dated 22 August 2000 to those recommendations
- For recommendations 1.1, 1.2, 1.3 ,3, 4.2, 5 and 6, best practices have been identified by information exchange amongst Members and discussions at three WP-meetings.
- Harmonised survey reporting practices fulfilling, in so far as practicable, the recommendations of NMD have been included in the revised tables attached.
- Standard survey reporting terminology (recommendation 2) is in the process of being prepared and will be submitted to GPG for approval as an IACS Recommendation with the title "Surveyor's Glossary". The completion of the glossary has been delayed somewhat due to pending illustrations of typical hull structures.

Council approved on 14 July 2003 (2249_).

***

<u>Part B: Incorporation of CAS related requirements into UR Z10s</u>

2. Objective

WP/SRC Task 106 – Incorporation of CAS related requirements into A.744

2. Points of discussion

The WP/SRC carried out this task according to the work specification of Form A and reported the outcome on 27 May 2003.

- Since CAS was developed for tankers only, WP/SRC considered whether there is any need to further develop/modify requirements in CAS with respect to bulk carriers. Hence, amendments to Z10.15.5.5(rafting), 5.6(survey planning), 8.2.2(different survey stations) and Table 1(close-up survey).
- IACS will submit its proposed amendments to Res A.744 as a result of this revision.
- NK GPG suggested that the word "<u>alone"</u> be inserted after "rafting" in Z7 and Z10.1(5.5.5)~10.5.
  - WP/SRC had considered this and felt that the insertion of the word "alone" will create a loophole as the text "Rafting alone will only be allowed..." could be interpreted that other means of access have to be used. Besides this wording would impede the use of rafting for survey of side and bottom structures of the spaces.
  - GPG considered that rafts/boats should be accepted as a means to move about within a tank to gain access to any temporary platforms that may be erected. Consequently, the wording of 5.5.5 was re-drafted and split into three parts (5.5.5~5.5.7) beginning with "<u>*Rafts or boats alone may be allowed for inspection of the under deck areas…"*</u>

    The same wording will be introduced into Z10.3, Z10.4, Z10.5, Z7 and Z7.1.

Approved on 08/08/2003 (0237h)

***

Prepared by the Permanent Secretariat

22 July 2003

Technical Background

UR Z10.2 (Rev.15, Dec 2003)

1. Objective :

Develop criteria for the extent and methodology of thickness measurements of frames of single side skin bulk carriers so as to ensure that UR S31 and UR Z10.2 include consistent, accurate and sufficient requirements.

2. WP/SRC Task 111

WP/SRC Task 111 completed on 10 Nov 2003 with new report form on Thickness Measurements of Cargo Hold Frames.

In addition, WP/SRC proposed the following changes:

1) to enhance the close-up survey requirements of the shell frames at Special Survey No.3 to include all shell frames in the forward and one other selected cargo hold and 50 % of frames in each of the remaining cargo holds. GPG agreed.

2) ships which are required to comply with UR S31 are subject to the additional thickness measurement guidelines for the gauging of side shell frames and brackets as given in the proposed new Annex V. GPG agreed.

3. GPG Discussion

GPG agreed to the following further changes:

1) Annex V, item 3.1: further modified to indicate that the 5 deepest pits within the cleaned area be gauged and the minimum thickness found recorded;

2) WP/SRC's proposed paragraphs relevant to face plates in both items 4.1 and 4.2 of Annex V were deleted;

3) Gauging method on flange and shell plating for bending check was newly introduced as item 4.3 of Annex V.

***

WP/SRC Task 102
HARMONIZATION OF UR Z7s AND Z10s

Technical Background
UR Z7 (Rev. 11)
UR Z7.1 (Rev. 2)
UR Z10.1 (Rev. 12)
UR Z10.2 (Rev. 17)
UR Z10.3 (Rev. 7)
UR Z10.4 (Rev. 2)
UR Z10.5 (Rev. 1)

Contents:

1. Objective

To amend UR Z7s and Z10s in order to make the texts of the above-mentioned URs consistent eliminating all the differences both in substance and in wording (WP/SRC Task 102).

2. Background

In the process of approving UR Z10.4, GPG found it necessary to amend the other existing URs Z10.1, Z10.2, Z10.3, Z10.6 and Z7 in order to eliminate any inconsistencies existing among them.

3. Methodology of work

The WP has progressed its work through many sessions, both during the periodical meetings and dedicated meetings restricted to a Small Group of Members (BV, DNV, GL, LR, RINA) who developed the work in order to be more efficient. All the proposed amendments of the Small Group have regularly been circulated to all Members for comment and agreement.

4. Discussion

4.1 The WP/SRC has completed a comprehensive comparative review of UR Z7 and Z10s, and identified inconsistencies which existed among them. During this review, attention was given to the severity of the requirements applicable to the same spaces/structural areas on different types of ESP ships. As a result, the inconsistencies were eliminated making the URZs harmonized. However, there has been no change to the scope and extent of the survey requirements.

4.2 The starting point for each UR was the most updated version available at the time of commencement. Any revision to the URZs, which were introduced during this task, was taken into account. As for instance, the UR Z10.1 was initially amended based on Rev. 9, while the last amendments are based on Rev. 11 and the UR Z10.2 was initially amended based on Rev. 13, while the last amendments are based on Rev. 16. The proposed revisions of URs Z10.1 and Z10.4 have not been numbered, as there will be revisions to those URs before the revisions introduced by the Task 102 are adopted. In fact, GPG is currently developing a Revision 12 of Z10.1 with the view to introducing significant improvements in the survey regime for ballast tanks (including combined cargo/ballast tanks) of oil tankers and UR Z10s applicable to oil tankers will also have to be revised by incorporating the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005 (see 4.3 below).

4.3 Also, in harmonizing UR Z10.1 and Z10.2 care has been taken to align the corresponding text with that of IMO Res. A.744(18). However, it has been noted that the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005, have not been incorporated into the IACS UR Z10s applicable to oil tankers. It seems that the updating of the above-said UR Z10s will be done by the Perm Sec and reviewed by the WP/SRC Chairman and then circulated for adoption by GPG with concurrence of Council Members for uniform application from 1 January 2005. It is understood that the revisions of the UR Z10s affected by those amendments will not include the changes introduced by the Task 102, as the implementation date proposed for those changes is 1 January 2006 (see below **6. Implementation**).

4.4 In the course of the work the WP has been developing for more than two years, several additional Tasks were assigned to the WP by GPG which affected the development of Task 102. The additional tasks which have been taken into account are the following:

1) In the course of Council discussion on UR Z10.6 (General Cargo Ships), certain inconsistencies were identified between Z10.6 and other Z10s. WP was instructed to expedite Task 102 (1060gIAa, 12 June 2002);
2) WP was instructed to include "Survey Planning for Intermediate Survey" into harmonization work (2108_IAa, 12 July 2002);
3) GPG instructed WP to consider whether Z10.6 should be re-assigned as Z7.1, in connection with the harmonization work. 1060gIAb, 20 Sept 2002.

Z7.1 developed;

4) Partial outcome (Z7 and Z7.1) was submitted to GPG on 17 July 2003(1060g). Council decided that approval of Z7(Rev.10) and Z7.1(Rev.2) is postponed until the harmonization is completed (1060gICb, 6 April 2004);
   Council Chairman instructed WP/SRC to Members' comments on the draft revision of UR Z7 and Z7.1 (collected under s/n 1060g, 1060gNKi (30/03/2004) in particular) on 6 April 2004.

5) GPG tasked WP to include the amendments to Z10.2 / Z11 (BCs with hybrid cargo hold arrangements), deleting sheets 15 and 16 for ore carriers, into the harmonized UR Z10s (2212aIGa, 19 Jan 2004);
6) GPG tasked WP to consider whether the requirements relevant to examination of Fuel Oil Tanks in the cargo area at each Special Survey should be put into Z 10s, and internal examination of FOT at Intermediate Survey after SS 2 is needed. (1060gIAf, 30 Jan 2004);
7) GPG tasked WP to harmonize tank testing requirements in Z7s and Z10s. (3006lIAa, 5 April 2004);
8) GPG tasked WP with Task 108 - Develop uniform survey requirements for air vent pipes including the welded connection to deck. Z22 developed. GPG instructed WP to incorporate Z22 into the harmonized Z10s;
9) GPG tasked WP with Task 114 - Verification and signature of TM reports. REC 77(Rev.1) developed and approved on 29 July 2004. Council approved parallel amendments to Z7.1 and Z10s (TM Forms included) and instructed WP to incorporate these into the harmonized Z10s:
   - Recommendation No.77 was revised (Rev.1, July 2004);
   - Z7.1 para.6.3.2 and Z10s para.7.3.2 so amended.
   - "Surveyor's signature" is deleted from all TM Forms in Z10s;
   - A note is added to Annex II(Z10s) declaring that Annex II is recommendatory.

   WP/SRC's investigation into Members' practice in dealing with verification and signature of TM reports is annexed for record keeping purpose. See Annex 2.

10) GPG tasked WP to consider the BV comments on "TM may be dispensed with…." and include the findings into the harmonized Z10s (2219iIAa, 7 April 2004).

5. Agreement within the WP/SRC

All Members have unanimously agreed the attached final versions of UR's.

6. Implementation

WP/SRC is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming Council adoption in December 2004, WP/SRC would propose January 2006 as implementation date.

Annex 1: TB for UR Z10.1(Rev.12, C49 amendments, see Permsec's note 1 below)
Annex 2: WP/SRC Task 114, verification and signature of TM reports(see 9 above).
Annex 3**:** TB for revision of UR Zs concerning "anodes".

Note by the Permanent Secretariat

1. Annex 1 to this TB contains background for amendments to UR Z 10.1(Rev.12) relating to FAIR/POOR/GOOD (C49 amendments). Council at its 49th meeting (June 2004) agreed/decided that comparable changes should be added to Z10.3 and Z10.4.

2. Appendix 3 "TM sampling method" has been added to UR Z10.1 and Z10.4 to keep them consistent with IMO Res.MSC.144(77). The amendments to A.744 contained in MSC.144(77) entered into force on 1 January 2005. *(GPG s/n 4181)*

Under s/n 4072g, paragraph **2.4.6** of UR Z10.1 and **2.4.6** and of UR Z10.4 (paragraph numbering is now harmonized) were amended in order to provide a link between the main text of the UR Z10.1 and 10.4 and the new Annex III Appendix 3 containing the MSC Res.144(77).

Further, it was agreed that the requirements for evaluation of longitudinal strength of the hull girder (as written in MSC.144(77)) should not be required for Intermediate Survey unless deemed necessary by the attending Surveyor. This is covered in 4.2.3.1 and 4.2.4.1 of Z10.1 and Z10.4.

3. GPG agreed that the amended UR Zs should be implemented from 1 July 2006 altogether.

4. DNV's proposed amendments to UR Z10.1, Z10.3 and Z10.4 concerning annual survey of ballast tanks were agreed by Council (1060gICq, 27 June 2005). See Appendix 2 to Annex 1.

5. Annex 3 contains a TB for revision of UR Zs concerning "anodes".

Date: September 2004
Prepared by the WP/SRC

– – –

Annex 1 to Technical Background
UR Z 10.1 (Rev.12, C49 amendments(coating-related))

1. Objective

To introduce significant improvements in the survey regime for ballast tanks (including combined/ballast tanks) of oil tankers as matter of strategic concern and urgency to IACS, given the aging of both the single and double hull tanker fleets and the problems encountered with corrosion of ballast tanks in several shipping casualties.

2. Background

Draft amendments to UR Z10.1 were submitted to Council 47 (June 2003) and agreed in principle.

3. Discussion

There was particular concern over accelerated corrosion with age (as the thinner the material, the more rapidly the allowable diminution margin percentage disappears) especially where coatings have broken down. There is also a disincentive for any spend on maintenance of the structure of a ship within a few years of its statutory scrapping date.

Council discussion by correspondence had evolved to the position of substantive proposals – summed as follows (3095_ABa, 2 June 2003):

1. Enhance the Intermediate Survey in Z10.1, Z10.3 and 10.4 for Tankers after 2nd Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey). This corresponds to the latest revision to UR Z10.2.
2. At Annual Survey of ballast tanks with substantial corrosion, the overall survey is to be replaced by close-up survey with thickness measurements of the exposed area.
3. Proposed to task WP/SRC to re-consider the acceptance criteria for the rating FAIR further. For this, eliminate FAIR, leaving only GOOD and POOR redefined as appropriate.
4. Proposed to task WP/SRC to explicitly require close-up survey of Suspect Areas identified at the previous Special Survey.

Council 47 discussed the proposals(June 2003) as follows:

1. Definition of FAIR
   Council 47 agreed that "FAIR" would be retained as a rating and that GPG should instruct WP/SRC to redefine FAIR, so that there would be a clear differences between FAIR, POOR and GOOD. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have the same scope as Special Survey No.2(Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

   Based on the strong majority, Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

   DNV and NK stated that they could not accept a requirement for annual surveys of ballast tanks when the coating condition is less

than GOOD and proposed that GOOD be changed to FAIR (3095_IGc, 30 June 2003)

2. ABS' proposed amendments to Z10.1(annual examination of BWTs in certain conditions) were approved.
3. C 47 agreed that the BWT coating requirements (Z10.1.2.2.3) for intermediate Survey after SS 2 should be the same extent to the previous SS.
4. Given the substance of the changes, the revised Z10.1 should be shown to Industry before adoption.
5. A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.

Following Council 47, the draft text of Z10.1(Rev.12) was distributed to Industry and discussed at the IACS/Industry meeting on 29 August 2003. Industry indicated that UR Z10.1(Rev.12) is acceptable, provided that appropriate IACS guidelines on coating repairs are developed.

The Small Group on Coating (SG/Coating) under WP/SRC prepared draft guidelines on coating repairs and considered the definitions of GOOD / FAIR / POOR. The SG/Coating did not change the definitions and found that the Guidelines provide useful clarifications on the definitions and criteria in achieving an industry wide uniform judgement of coating conditions as well as what is needed to restore GOOD conditions.
Further, an IACS/Industry JWG/Corrosion was established and met in February 2004. The outcome is (3095_IGh, 4 June 2004):

- Draft Guidelines on Coating Repair (IACS REC 87)
- Draft UR Zxx (mandatory coating of cargo tanks on oil tankers)
- Draft UI SC 122 (Rev.2) – mandatory coating of ballast tanks

4. Others

1. Z10.11.2.2bis - Definition of "Combined Cargo/Ballast Tank. …as a routine part of the vessel's operation and will be treated as a Ballast Tank. ...". By so amending, Z10s do not need to repeat "Ballast Tanks *and Combined cargo/salt water Ballast Tanks*" in addressing the ballast tanks. Hence, all the references to "*and Combined cargo/salt water Ballast Tanks"* were deleted.
2. Z10.1.2.2.1.2: The aim of the examination is ~~to be sufficient~~ to discover substantial corrosion…
   Comparable changes are to be added to other UR Zs wherever the same sentence occurs.
3. "IACS Guidelines for Coating Maintenance & Repairs for Ballast Tanks and Combined/Ballast tanks on Oil Tankers" are referenced where relevant.
4. Comparable changes are to be added to UR Z10.3 and Z10.4, after adoption of Z10.1(Rev.12).

Attached: Memo on Coating Matters (GPG Chairman)

9 June 2004
Prepared by the Permsec

Appendix 1 to Annex 1: MEMO on Coating matters

1. Background and discussion within IACS on UR Z10.1 (draft Rev.12) between 29/01/03 and 14/08/03

In view of the survey experience with oil tankers, it was proposed that all ballast tanks should be examined, routinely and uniformly, at annual surveys on ESP tankers exceeding 15 years of age. IACS should amend UR Z10.1 to require the examination of ballast tanks on such ships at each annual survey. This is simple, clear and thorough and not subject to interpretation. (2242_ABq dated 29/1/03)

Then, ABS modified the proposal asking, for tankers subject to URs Z10.1, Z10.3 and Z10.4, exceeding 15 years of age, that the current requirement - pertaining to annual examination of Ballast Tanks adjacent to cargo tanks with any means of heating - be deleted and replaced by a simpler and more stringent requirement that all Ballast Tanks be subject to survey at each subsequent annual survey where either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and the protective coating is not renewed at special survey or intermediate survey. This will ensure that all Ballast Tanks with substantial corrosion or protective coating which is not in GOOD condition at the time of special survey or intermediate survey will be examined at each subsequent annual survey on tankers exceeding 15 years of age. (2242_ABzb dated 14/3/03)
This was later expanded to include all tanks used routinely for ballast water, both ballast-only and cargo/ballast tanks (2242_ABzc dated 14/3/03).

ABS further reviewed the issue of the survey of salt water ballast spaces and combined cargo/salt water ballast spaces with ABS' governing bodies in light of recent casualties and survey findings on other tankers. Their review found an increasing amount of coating breakdown/failure and subsequent rapid wastage in key structures after Special Survey No. 2, i.e. after 10 years of age. These conditions are most prevalent in the under deck structure and the side shell structure in way of the deep loadline. In a number of cases the serious wastage has caused fracturing of the under deck longitudinals and in some cases fracturing has extended to the main deck structure. This led ABS to refine proposed amendments to URs Z10.1, Z10.3 and Z10.4 to require (2242_ABzf dated 9/5/03):

a. For Tankers exceeding 10 years of age

Salt Water Ballast Spaces and Combined Cargo/Salt Water Ballast Spaces. For tankers exceeding 10 years of age, salt water ballast spaces and combined cargo/salt water ballast spaces are to be internally examined at each subsequent Annual Survey where substantial corrosion is found within the tank or where the protective coating is found to be less than GOOD condition and protective coating is not repaired. Internal examination to be an Overall Survey.

b. For Tankers exceeding 15 years of age:

Salt Water Ballast Spaces and Combined Cargo/Ballast Spaces. For tankers exceeding 15 years of age, salt water ballast spaces and combined cargo/ballast spaces are to be examined internally at each subsequent Annual Survey. Where substantial corrosion is found within the tank, or where the protective coating is found to be in less than GOOD condition and the protective coating is not repaired then in addition to an Overall Survey, under deck structure and the side shell structure in way of the deep loadline is to be subject to Close-up Survey.

NK and BV replied that the proposed amendments made by ABS need to be substantiated in a transparent manner with technical data that ABS may possess and put forward for further assessment and discussion. (2242_NKn dated 14/5/03 and 2242_BVz dated 16/5/03)

DNV (2242_NVn dated 2/6/03), having carefully considered the practical consequences of taking the ship off-hire for gas freeing etc. and being concerned about the difficulties to have these surveys executed in a safe manner and whether the intended safety benefits in implementing the proposed extended scope of the annual survey of Ballast tanks will be met, **proposed the following alternative measures** which would be as effective and may not have such delaying effects to the ship:

1) Enhance the Intermediate Survey in UR Z10.1, 10.3, and 10.4 for Tankers after the 2 Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey. (This will correspond to the latest revised requirements of UR Z10.2 for Bulk Carriers.)
2) At Annual Survey of ballast tanks with substantial corrosion the overall survey should be replaced by close up survey with thickness measurements of the exposed area. (An overall survey of these tanks does not give sufficient information of the development of the areas with substantial corrosion.)
3) Further we will not fail to mention that the WP/SRC has proposed to extend the close up survey in cargo and combination tanks to 30% from the 3 Special / Renewal Surveys.
4) **Experience has shown that the coating condition rating category FAIR has a tendency to be stretched too far into the POOR condition. We will therefore propose that we task the WP/SRC to reconsider the acceptance criteria for the rating FAIR further.**
5) We do also question the need for redefining the definition of combination tanks, particularly since the category I tankers which are the ships that normally are fitted with these type of tanks are to be phased out 2 to 4 years from now. However DNV will not oppose to such a redefinition.

DNV requested Members to consider the above as an alternative to the ABS proposal, bearing in mind that we ought to present this to the industry prior to deciding.

ABS (3095_Aba dated 2/6/03), having further considered its earlier proposals in light of NVn, submitted a revised proposal for consideration by Council at C47 and replied to the above 5 DNV proposals as follows:

1) ABS fully supports this proposal.
2) While ABS agrees with this proposal, it is in fact already provided for in Z7 (3.2.3) and Z10.1 (3.2.5.1)--which require that "Suspect areas (which include any area where substantial corrosion is found) identified at previous Special Survey are to be examined. Areas of substantial corrosion identified at previous special or intermediate survey are to have thickness measurements taken." To us, this implies that close-up survey of these areas is to be done at annual survey in conjunction with the thickness measurements. However, we can

agree to tasking WP/SRC to explicitly require "close-up" survey in this connection and to amend Z7, and all the Z10's, appropriately to make this explicit, if there is majority support for this.

3) We agree that this has been put forward to GPG by WP/SRC via 0237hNVb, 27 May. However, these additional CAS close-up survey requirements do not apply to salt water ballast tanks; only to cargo oil tanks and combined cargo/ballast tanks.
4) **We agree with this assessment and we propose that the only way to eliminate the subjectivity and raise the standard is to eliminate the category "FAIR" completely; leaving only "GOOD" and "POOR" redefined as follows:**
   "GOOD -- condition with no breakdown or rusting or only minor spot rusting.
   POOR -- any condition which is not GOOD condition."
5) ABS does not agree with this proposal. We are particularly concerned that we need a very thorough and robust survey regime for these tankers precisely because they are subject to mandatory phase out over the next several years. We are very concerned that without additional IACS requirements, these tanks will receive little or no inspection and maintenance by owners or others after their last special or intermediate survey, if no substantial corrosion is found at that time. Rapid, localized wastage in way of deteriorating coatings may pose significant hazard if the survey regime is not further tightened as we are proposing.

In conjunction with the above comments on DNV proposals, ABS further considered their previous proposal in ABzf and modified it as follows:

- **ABS simplified the proposal to require annual examination of all salt water Ballast Tanks and combined Cargo/salt water Ballast Tanks irrespective of age, when either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and is not repaired.**
- the requirement for annual (close-up) examination of salt water ballast tanks and combined tanks is already required in Z10.1 (3.2.5.1). ABS proposed adding it to 2.2.3 for clarity and emphasis so that all the conditions which may lead to annual examination of such tanks are listed together in one place.
- Since the principal problem that we are trying to address is rapid, localized corrosion in way of breakdown or deterioration of the protective coating, we are proposing that the coating condition should be found and kept in "GOOD" condition to obviate the need for annual examination. **The attached proposal is made together with the proposals in items 3.1 (intermediate following Special survey 2 to have same scope as prior Special survey) and 3.4 (eliminating "FAIR" and redefining "POOR" as any condition other than "GOOD" condition.**

ABS requested to decide on a course of action at C47 for tightening the survey regime for tankers. They agreed that industry be informed of Council's decisions in this regard prior to IACS making the decision public, but IACS should maintain its independence and take decisive action in this matter. Debate with industry can only lead to delay and to a watering down and compromising of these important requirements.

NK agreed to task WP/SRC to reconsider the acceptance criteria of "FAIR" for clearly define the border between "FAIR" and "POOR" condition. However, **NK strongly opposed the elimination of "FAIR" coating condition from UR Zs** because this can not resolve to remove subjectivity of coating assessment. The three-categorization system of coating condition should be retained. (3095_NKa dated 5/5/03)

Outcome of C47

At **C47**, it was agreed that "Fair" would be retained as a rating and that GPG should instruct WP/SRC to redefine "Fair", so that there would be a clear differentiation between "Fair", "Poor" and "Good". It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have same scope as Special Survey No.2 (Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

Based on strong majority support Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

This matter should be discussed with Industry prior to adoption of any UR by Council.

In a final summary, the Chairman proposed that a constructive dialogue with Industry should take place on the IACS proposal as set out in WP1 plus maintaining 3.2.5.2 modified to say that ballast/combined ballast/cargo tanks will be subject to annual survey when considered necessary by surveyors.

After discussion in the JWG (Industry/IACS), GPG should propose final rules for this matter to Council, including acceptable repair definition.
FUA 17: *To instruct WP/SRC to develop guidance on coating repairs and more precise definition of "Fair" coating condition.*
Once approved, these requirements should be incorporated into Z10.3 and Z10.4.
FUA 15
1) To prepare a draft revision to UR Z10.1 incorporating C 47 decisions:
- *The definition of "FAIR" remains as it is;*
- *ABS proposed amendments to Z10.1 (annual examination of BWTs in certain conditions) were approved;*
- *C47 agreed that the BWT coating requirements (Z10.1.2.2.3) for Intermediate Survey after Special Survey No.2 should be the same extent to the previous Special Survey.*
- *Given the substance of the changes, the revised UR Z10.1 should be shown to Industry (OCIMG/Intertanko first among others) before adoption for their review and comments.*
- *A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.*

2) GPG Members are to confirm the draft revision to Z10.1 in consultation with their WP/SRC members by correspondence. See 3095_IGa of 13/06/03.

According to C47 FUA 15, GPG Chairman circulated (3095_IGa dated 13/6/03) draft amendments to UR Z10.1 as agreed in principle at C47.

Having received a number on comments, GPG Chairman (3095_IGb dated 27/6/03) informed that the Council Chairman confirmed that GPG is not to amend the principles agreed at C47, i.e. we are not empowered to change "GOOD" to "FAIR" as proposed by DNV and NK, nor to amend the definitions of "FAIR" and "POOR" as proposed by DNV.

DNV's intention to possibly lodge a reservation was noted, however the matter should be raised at Council and not be dealt with by GPG. An amended draft text incorporating the non-substantive changes proposed by Members was circulated.

DNV said that its understanding was that the draft should be circulated to the Industry (ICS, INTERTANKO, and BIMCO) prior to adoption by Council. (3095_NVc dated 30/6/03)

GPG Chairman (3095_IGc dated 30/6/03) circulated a draft amendment of UR Z10.1 for Council's agreement and use in discussions with the industry associations.
The draft was generally agreed by GPG but individual Members have requested that the following matters (which were deemed to be outside the remit of GPG in this task) be brought to Council's attention for further consideration:

1 DNV and NK stated that they can not accept a requirement for annual surveys of ballast tanks when the coating condition is less than GOOD and propose that GOOD be changed to FAIR.
2 In connection with item 1 above, DNV also propose to amend the definitions of FAIR and POOR in order to raise the standard of FAIR.

Council Chairman (3095_ICb dated 14/8/03) concluded that Council has agreed that the draft amendments to UR Z10.1 attached to IGc reflect Councils' decision taken at C47 and that they be circulated to industry associations.
Perm Sec was therefore invited to submit the draft to OCIMF and INTERTANKO in view of discussion at the IACS/ industry meeting on 29 August.

2. Discussion with Industry (29/08/2003 – 11/10/2003)

As requested by Council, the whole matter was presented to Industry during the "general matters" meeting with IACS held on 29 August 2003; comments from Industry were requested. In the following an extract from the minutes of the meeting (see message 3100aIAb dated 5 September 2003):

___________________________ from Meeting minutes _________________________________

4. & 5. Annual surveys of ballast tanks and IACS guidelines on coating repairs
M. Dogliani introduced the matter (see Items 4&5 in Appendix).

A. LinoCosta gave a presentation to show where concerns and decisions stand: too many cases when coating was considered fair at SS but problems occurred just after one/two years.

N. Mikelis commented on draft amendments to Z10.1 (Rev.11) stating that the extent of annual survey is not clear; it should be limited to the affected zones, e.g. coating breakdowns, only.
M. Guyader clarified that, in this draft amendments, it is expected an overall survey of the whole tank and a close up survey of the affected zones.
N. Mikelis noted that, in the draft amendments to Z10.1 (Rev.11), the intermediate survey at 12.5 years would have the same scope as the previous special survey and that needed a justification. See 7 a).
M. Dogliani said that Z10.1 (Rev.11) was adopted in August 2003 and will be introduced into IACS Societies' Rules over the next year.

Conclusions:
4.1 Industry shared IACS concerns on coatings and, in general, agreed with the draft amendments to Z10.1 (Rev.11) suggesting also extending them to Z10.2 on bulk carriers

4.2 Industry agreed that a guideline for surveyor on coating would greatly improve uniform application of so-amended Z10.1 including issues such as how to consider load bearing elements when judging GOOD/FAIR/POOR status and how to consider bottom pitting in connection with GOOD conditions
4.3 Industry will more precisely comment, by the end of September, the draft Z10.1 so as for IACS to finalise the matter, as planned, for the Council's December meeting.

Item	Title	Industry recommandation	IACS/ M. Dogliani Introduction
4 & 5	Annual survey of ballast tanks IACS guidelines on coating repairs	NN	**1. IACS is considering the following:** - **amend UR Z10.1 (draft circulated to Industry) to the effect that in case at Special Survey or Intermediate Survey the coating in a ballast tank is found less than GOOD, either GOOD conditions are restored or the tank's coating is inspected at each annual survey;** - **develop IACS guideline to assist an uniform application of the so modified (if adopted) UR Z10.1; the guideline should address which repairs are necessary to restore GOOD conditions from FAIR and POOR respectively and which are the criteria for the restored (after repair) situation to be rated as GOOD.**

______________________________ End of extract from minutes ____________________________

INTERTANKO commented (see R. Leslie email to GPG dated 25 September 2003):

- expressing their concern for the draft Z10.1 and underlining

a) targeting: concerns that, if not properly dealt with, Z10.1 would target all ships and not just those which need intervention; the view was expressed that guidelines would probably solve the matter;

b) definition: indicating that the current definitions of GOOD, FAIR and POOR is not clear enough and that the matter would be even worst with GOOD and NON GOOD; again it was indicated that guidelines could solve the matter;

c) expertise: expressing doubts on IACS' surveyors expertise and ability to judge coating conditions; in this respect they (hiddenly) suggest that IACS position is unclear when we say that we are not competent to judge the coating during construction but then we are competent to judge coating during operational life. Even if not explicitly stated, the impression is that also in this case guidelines would help.

Additionaly, INTERTANKO suggested a (quite detailed) set of assessment criteria.

The matter was then finally addressed at the TRIPARTITE Meeting (held in Soul on 29/30 September 2003). There Industry agreed that the way forward was the (joint) development of IACS guidelines (see minutes attached to message 3100_RIe dated 11 October 2003, an extract of which is reproduced below).

______________________________ Extract from the TRIPARTITE minutes ________________

Industry is concerned by the definition of GOOD/NOT GOOD in relation to coating repairs and acceptance criteria. Industry agreed that new guideline on this, which IACS is already producing, was the way forward.

______________________________ End of the extract from the minutes __________________

3. Further developments

a) from the above, it was concluded that, provided the guidelines are sound, Industry would accept the concept of Z10.1 (draft) Rev. 12, therefore an IACS team and a JWG were established in order to progress the matter of the guidelines (among other related matters).
b) the team of IACS experts on coating developed draft guidelines and provided recommendations to GPG on the way forward (attached to message 3095bNVc dated 20 November 2003).
c) the guidelines were discussed within the JWG with Industry (see draft minutes circulated within GPG with messages 3095cIGd and 3095cIGe both dated 13 March 2004)
d) further suggestions and comments (as requested at the meeting) were provided by Industry (not circulated to GPG)
e) Bulk Carrier Industry is recommending that similar guidelines are developed in due time also for bulk carriers
f) at DE47 and MSC78, IMO is asking Industry and IACS to develop (compulsory) performance standards for coating of newbuilding (double hull spaces of DSS Bulk Carriers), a matter which is, indirectly related to the above one.

1 June 2004
M. Dogliani

Subject: FW: 1060gNVs; WP/SRC - Task 102 - Harmonization of UR Z 7 and Z 7.1

25 May 2005

To: Mr. B. Anne, Chairman of IACS Council,
cc: Council Members, IACS Perm. Sec.

Ref.: My mail NVr dated 20 May 2005

DNV have further studied the amendments to UR Z10.1, Z10.3, and Z10.4, and as a result are presenting the following as a compromise solution:

General comment:
From the comments by other Members it is obvious that there is reluctance to accept annual surveys of ballast tanks with a common plane boundary to heated cargo tanks in the case where the coating is in good condition. This is particularly unreasonable as at the same time we enhance the Intermediate survey of Tankers between 10 and 15 years to also include examination of all ballast tanks, meaning that all ballast tanks will be close up surveyed with 2-3 years intervals from the ship is 10 years old, with the possibility for the surveyor to require thickness measurements and testing of the tanks to ensure the structural integrity of the tanks if necessary.
It is also proposed for the Intermediate survey between 5 and 10 years, to increas the scope from representative to all ballast tanks, a requirement DNV find to strict, and require that we here keep the original text.
If a ballast tank is found to have coating in GOOD condition at the renewal or intermediate survey, a deterioration of the tank beyond structural reliability is very unlikely even if the tank has a common plane boundary to a heated cargo tank.

DNV finds it particularly unreasonable to have this requirement to apply
to double hull tankers for the following reasons:
- these ships have double hull and the risk of pollution is here much reduced,
- the double hull is constructed with small spaces giving improved structural reliability,
- almost all double hull tankers below VLLC have heated cargo tanks, and all ballast tanks have common plane boundaries to these tanks, meaning that this requirement will apply to a major part of the tanker fleet in the future,
- the ballast tanks of double hull tankers are so designed that a general examination of these tanks will be identical to a close up survey,
- survey of ballast tanks of double hull tankers will mean either gas freeing of all cargo tanks or at least dropping the inert gas pressure of all cargo tanks in addition to proper airing of all ballast tanks.

Since the single hull tankers will be faced out in the near future, and for clear political reasons, DNV will as a compromise proposal to keep paragraph 2.2.3.1 and 4.2.2.2 in Z 10.1 as amended by Council (ref. IAo) but amend it to not include 2.2.3.1.e, 4.2.2.2.e and last paragraph of 3.2.5.1 in Z10.3 and Z10.4. In addition we request that the original text of 4.2.2.1 is kept.
If BV, ABS and other Members can accept this DNV is willing to drop our reservation presented at C49.
DNV's proposal will then be as follows:

Z10.1:

2.2.3.1: This paragraph can be accepted as is for the reasons stated above.
3.2.5.1: This paragraph is accepted as amended.
4.2.2.2: This paragraph can be accepted as is for reasons stated above.

For other comments to Z10.1 see NVo and NVp.

Z10.3:

2.2.3.1.e to be deleted.
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept."For tanks used for water ballast ---"
4.2.2.2.e to be deleted

Z10.4

2.2.3.1e to be deleted
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept, "For tanks used for water ballast --"
4.2.2.2.e to be deleted.

For details see attached document where the text for the requirements in Z10.3 and Z10.4 that DNV will accept is stated.

Best Regards

Arve Myklebust
on behalf of
Terje Staalstrom
DNV IACS Council Member

Annex 2 to TB (Harmonization Z10s)

WP/SRC Task 114 "Clarify the procedure of verification and signature of the thickness measurement report"

Item No.	Item	ABS	BV[1]	CCS	CRS	DNV	GL	IRS	KR	LR	NK	RINA	RS
1	**Verification onboard**	.											
1.1	Minimum extent of measuring points for direct verification by attending surveyor specified	No	No	No	No	No	No	No	Yes	No	No	Yes	No
1.2	Preliminary TM record to be signed upon completion of the measurements onboard	Yes	Yes [7]	Yes	No (copy taken)	No[3]	No[6]	Yes	Yes	Yes	Yes	No[8]	No
2	**Final TM report**												
2.1	Signature of all pages in TM record required	No	No	No	Yes	No	Yes	Yes	No	No	No[5]	Yes	Yes
2.2	Signature of 'cover' ('general particulars') page only	Yes	Yes	Yes	No	Yes	No	No	No[4]	Yes	Yes	Yes	No
2.3	Measuring points verified by attending surveyor required identified in TM record and signature of the corresponding pages required	No	No	Yes Without signature	Yes	No	No	No	Yes	No	No	No	No

2004-04-20

1) Instructions not clear regarding signature of the thickness measurement record

2) Signature on front and last page, stamp on all other pages, or signature on each page (IACS TM forms)

3) Upon completion of measurements onboard a draft report in electronic format (DNV TM template, including operator's notes as relevant) to be given to attending surveyor

4) Signature of cover page, pages of meeting record and pages of attended measuring points

5) Each page to be signed in case of 'loose-leaf' type record

6) Preliminary TM record has to be passed to the Surveyor, signed by the Operator

7) The only measures which the Surveyors can certify exact are those for which that they have seen the results on the screen of the apparatus. That means in fact few points in comparison with the numbers of recorded measures.

8) The Surveyor reviews the TM record for completeness and assessment of TM readings, but no signature required.

Annex 3: **Technical Background**
(May 2005)

UR Z7s and Z10s (Corrosion Prevention System)

1. Objective:

To clarify whether the survey of anodes is a class matter, and if so, whether acceptance criteria for anode should be developed.

2. Method: GPG by correspondence (5037_)

3. Discussion

3.1 BV initiated GPG discussion as follows:

Paris La Défense, 8 Mars 05

1 - We have noticed that, in the draft UR Z's (7.1, 10.1 to 10.5) issued further to the WP/SRC Task 102, the original sentence "......the examination may be limited to a verification that the hard protective coating remains efficient......" has been replaced by ....that the corrosion prevention system remains efficient....". in a number of paragraphs (such as , for instance, Z 7.1, 4.2.3.1 a) ; Z 10.2 4.2.3.3 ;), in line with IMO Res.A744(18).

2 - However, a corrosion prevention system is defined, in the same UR Z's and in IMO Res.A744(18) , as being either a full hard protective coating or a full hard protective coating supplemented by anodes.

3 - The above would mean that the survey of the anodes is a classification matter.

4 - However, whereas coating conditions are defined as good or fair or poor, there are no criteria in the IACS URs and IMO Res. A744(18) for the anodes condition.

5 - Assessing the anodes condition to confirm that they "remain efficient" looks to BV to be a quite difficult task for the ships in service Surveyor.

6 - Member's view and interpretations on the following would consequently be appreciated:
- do Members consider that the above requirements in IACS URs imply that survey of anodes is part of the classification ?
- do Members consider that the above requirements in IMO Res. A 744 (18) imply that survey of anodes is mandatory?
- if yes, what is the acceptance criteria to conclude that the anodes" remain efficient" ?

3.2 The majority of GPG Members replied that they did not include requirements for anodes in their class rules.

LR / ABS / DNV / KR / NK / RINA / RS were of the view that the condition of any anodes fitted should be recorded for information purposes as the survey of anodes is neither a classification matter nor a mandatory requirement in IMO A.744(18) and has no impact on future surveys (5037_LRa**). [**Note; LR further clarified that “Whilst I agree that the performance of anodes is not normally a class matter LR does require that as part of Special Survey on oil tankers : "The attachment to the structure and condition of anodes in tanks are to be examined ." Therefore we cannot say that 'the survey of anodes is not a classification matter'**. 5037_LRb]**

However, GL said that “for GL, anodes are a matter of class and as such are subject to plan approval as well as surveys. In case of missing or worn-out anodes we issue a condition of class”(5037_GLa&b).

CCS advised that its rules have a general requirement relating to anode survey, which is only conducted, through sampling, during construction, docking survey or where there is a definite requirement for the survey of ballast tanks.

NK proposed that the following footnote be added to Z7s and Z10s:
“The survey of anodes is not a classification matter.” No majority support was achieved.

4. Conclusion

RINA suggested to simply amend the definition of "Corrosion Prevention System" in paragraph 1.2.9 of UR Z7 (and, of course, the paragraphs in all the other UR Zs containing the definition of "Corrosion Prevention System") in order to eliminate any reference to anodes. This proposal would leave room for Societies willing to include additional class requirements for anodes to do so in their Rules.

GPG agreed.

RINA proposed amendments to paragraph 1.2.9 of UR Z7
and corresponding paragraphs in all other UR Zs
(5037_RIb, 6 April 2005)

1.2.9 Corrosion Prevention System

A corrosion prevention system is normally considered ~~either:~~ <u>a full hard protective coating.</u>
~~.1 a full hard protective coating, or~~
~~.2 a full hard protective coating supplemented by anodes.~~
Hard protective coating is usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer’s specifications.
Where soft coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

Annex: Council Chair’s conclusive message.

6 May 2005
Permsec

Annex. (5037_ICb, 15 May 2005)

To : All IACS Council Members
c.c : Mr. R. Leslie, IACS Permanent Secretariat

Ref. Mr G-Y. Han's message IAa dated 6 May 05
Message ICa dated 6 May 05
Admiral R.E. Kramek's message ABb dated 13 May 05

Paris La Défense, 15 May 05

1 - All Members have agreed with the texts attached to Mr Han's message.

2 - Further to ABS comments the reference to anodes is to be deleted in Annex I and in tables IX (IV) and IX(II).

3 - further to ABS questions regarding what IACS plan to do regarding IMO and A.744(18) further to IACS deletion of reference to anodes from the UR Z7's and UR Z10's it is to noted that:

The Item 1.2.9 in UR Z1O.1 and relative items in these URs states
1.2.9 10 Corrosion Prevention System: A corrosion prevention system is normally considered either:
.1 a full hard protective coating, or
.2 a full hard protective coating supplemented by anodes.
Hard Pprotective Ccoating is to usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specification.
Where Soft Coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

- therefore the anodes are not considered as the main means of protection against the corrosion It is only a supplement;

- there is no provision in UR Z7's and Z10's to evaluate the level efficiency of the anodes;

- there is no specific requirements in case of lack of efficiency of the anodes.

The experience has shown that ballast tanks only protected by anodes are subject to corrosion when the anodes are becoming less efficient.

The anodes are active only when immersed by sea water. Therefore the upper part of the ballast tanks are not protected when the ballast is full of water and the ballast is not protected when it is empty..

The ships operators are reluctant to replace the anodes especially in upper part which request fitting of scaffolding fo welding the anode supports to the structure.

The above arguments justify the reasons why IACS consider that the anodes are not class item.

4 - These arguments can be used by IACS Members attending the WG bulk carriers at MSC 80 to try to obtain deletion of the reference to anodes in A. 744(18).

Best regards,

Bernard Anne
IACS Council Chairman.

TB

UR Z10.2(Rev.18, Corr.1 Jan 2006)

1. **Para. 1.4 and 7.1.3**

2. **Para. 5.5.4 and 5.5.6**

<u>Survey Panel Task 22 – Amend applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.</u>

<u>Technical Background</u>

<u>Z7(Rev.12)</u>
<u>Z7.1(Rev.3)</u>
<u>Z10.1(Rev.13, para.1.4 & 7.1.3)</u>
<u>Z10.2(Rev.18, para. 1.4 & 7.1.3)</u>
<u>Z10.3(Rev.8, para. 1.4 & 7.1.3)</u>
<u>Z10.4(Rev.3, para. 1.4 & 7.1.3)</u>
<u>Z10.5(Rev.2, para. 1.4 & 7.1.3)</u>

1. **Objective**

To amend the applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

2. **Background**

IACS QC findings, through audits of numerous Societies, which indicated concerns over Surveyor attendance and control of thickness measurement processes.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

To align Close-up survey requirements and thickness measurements in the applicable URZ7s and URZ10s, in accordance with PR19, all Panel members agreed through correspondence and a final vote at the fall Survey Panel meeting, that URZ7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 should include in the applicable sections of the noted URs as proposed by the Survey Panel the wording " In any kind of survey, i.e. special, intermediate, annual, or other surveys having the scope of the foregoing ones, thickness measurements of structures in areas where close-up surveys are required, shall be carried out simultaneously with close-ups surveys."

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Technical Background

UI SC 191 (Rev.2, Oct 2005)

&

UR Z10.1 (Rev.13)
UR Z10.2 (Rev.18)
UR Z10.3 (Rev.8)
UR Z10.4 (Rev.3)
UR Z10.5 (Rev.2)

1. Objective

- to confirm whether the guidelines for approval/acceptance of alternative means of access (now REC91, ex Annex to UI SC191) is mandatory or non-mandatory.
- to consider other safety related proposals.

2. Background

The DNV proposal to submit the UI SC191(Rev.1, May 2005, Annex 1) to IMO DE49 triggered a number of discussion points that led to amendments to the following resolutions:

UI SC191(Rev.2)
New REC 91
REC 39(Rev.2)
UR Z10s

Points of Discussion

3. Is the Annex to UI SC191(Rev.1, May '05, guidelines for approval / acceptance of alternative means of access) mandatory or non-mandatory ?

   Answer: Non-mandatory. Hence, re-categorized as new REC 91.

4. Limitation of use of rafts in bulk carrier holds

   DNV proposed that conditions for rafting should be limited to areas, such as anchorage or harbour, where swell conditions are limited to 0.5m. After discussion, GPG approved the ABS' alternative proposal to use the swell condition as a basis to determine the appropriateness of rafting, instead of geographic areas(harbours or anchorage). 5.5.4 of Z10.2 refers.

RINa proposed that para 5.5.4 should be included in all the Z10s. NK's objection is recorded as follows (3037hNKq, 29/08/2005):

> 1. With regard to RIm of 26 August 2005, NK considers that the proposed amendment to 5.5.4 should be limited to UR Z10.2.
>
> 2. Rafting survey for tankers are actually carried out on the open sea from a discharge port to a loading port and in such situation the rise of water within the tanks would always exceed 0.25m. It is different situation from rafting survey for hold frames of bulk carriers normally conducted in a harbour or at an anchorage.
>
> 3. If the same requirement applies to tankers, any rafting survey for cargo oil tanks and ballast tanks of tankers would be prohibited. This is not practicable under present survey procedure for tankers.
>
> 4. Therefore, NK can not support Laura's proposal that the proposed amendment to 5.5.4 of UR Z10.2 is introduced into the other URs and new Recommendation.

For compatibility with the IMO's mandatory requirements*, GPG decided to add the same amendment to all the UR Z10s.

*

- Appendix 4 to MEPC.99(48) ' Mandatory requirements for the Safe Conduct of CAS Surveys'
- MSC.197(80) – amendments to A.744918), Annex A for DSS and SSS bulk carriers and Annex B for single and double hull oil tankers.

As a consequence, 5.5.1 of REC 91(ex Annex to UI SC191) was also amended:

-to remove the reference to dynamic /sloshing (as the 0.25m rise was considered negligible);
-to refer to the rafting conditions contained for cargo holds in Z10.2 and Z10.5 and for oil cargo tanks in Z10.1 and Z10.4.

5. Means of access from longitudinal permanent means of access within each bay to rafts

GPG reviewed the proposal that the following text be added to Z10s:

A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay.
(Technical Background: for the safety of surveyors)

There may be ships which are arranged in accordance with para b, page 8 of the Annex to the current SC 191 (i.e., no means of access from the LPMA in each bay to a raft is required) and therefore could not be rafted if the sentence proposed by RINA("A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay") is included in the Z10's.
GPG therefore agreed not to include this sentence in Z10s.

For the same reason, the same sentence was not added to Rec.39.

Finally, GPG added the following sentence to UI SC191(interpretation for II-1/3-6):

> *A permanent means of access from the longitudinal platform to the water level indicated above is to be fitted in each bay (e.g permanent rungs on one of the deck webs inboard of the longitudinal permanent platform).*

6. Implementation

It was agreed that the revised UI SC191 be implemented to ships contracted for construction 6 months after adoption by Council.

UI SC191 was also edited in line with IMO MSC/Circular. 1176, leaving its mandatory language (is/are to, shall) unchanged.

> (Note: UI SC191(Rev.2) makes references to the following new Recommendations:
> - REC 90: Ship Structure Access Manual
> - REC 91: Guidelines for approval/acceptance of Alternative Means of Access)

23 September 2005
Permanent Secretariat
Updated on 13 Oct 2005.

Survey Panel Task 11 – Unified Periodic Survey Requirements related to SOLAS Reg. XII/12 & Reg. XII/13.

Technical Background
Amendments to UR Z10.2(Rev.19, Jan 2006) and UR Z10.5 (Rev.3, Jan 2006)

1. **Objective**

To amend UR 10.2 Section 2.6 and 3.4 and UR Z10.5 Section 2.6 and 3.3 to include survey requirements related to SOLAS reg. XII/12 and XII/13.

2. **Background**

This task was originally discussed during the WP/SRC annual meeting which took place at DNV Headquarters on the 26th to 28th October 2004; it was subsequently recorded under paragraph 9 "any other business" of the minutes of this meeting.
While the SOLAS Reg.XII/12 (hold, ballast and dry spaces water level detectors) and XII/13 (availability of pumping systems) retroactive requirements for existing bulk carriers have entered into force on 1st July 2004, as required by IMO Res.MSC.134(76), the IACS UR S 24 has been deleted on 1st January 2004.In addition, SOLAS does not include any periodical survey requirements for such detection systems and pumping systems.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel member from BV raised this issue at the February 2005 Survey Panel meeting and volunteered to propose amendments to the applicable URs for Panel members to review and comment on through correspondence. At the Fall meeting of the Survey Panel, it was agreed upon by all Panel members that the proposed amendments for UR Z10.2 and Z10.5 as applicable, which were proposed by BV were acceptable.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Submitted by Survey Panel Chairman
4 Nov 2005
approved on 31 Jan 2006 (5031fICa)

Survey Panel Task 4 –
Means of Access for Close-Up Surveys of Capesize Bulk Carrier hold frames
Technical Background
UR Z10.2 / Section 5.3 (Rev. 20, s/n 4110a, 10 Feb 2006)

1. Objective

To amend the requirements of UR 10.2 section 5.3.2 regarding the Close-up survey of hold frames with respect to acceptable means of access.

2. Background

In a report to Council at C50 on the loss of side shell on a capesize vessel, it was stated that issues regarding the means of access for survey of hold frames was raised by the incident which had Council request the Survey Panel to review the current requirements for means of access for the surveyor, especially on existing capesize vessels.

3. Methodology of Work

The Survey Panel, at its February 2005 meeting decided that this task should be dealt with by a project team, led by NK with members from BV, ABS, KR and CCS participating.

4. Discussion

The members of the project team, through correspondence and one meeting in Japan, came to an agreement on the revisions to URZ10.2 Section 5.3..2 on how to address the concerns of Council. It was decided that the requirements for means of access be divided into two sections to better define the requirements applicable to each size of vessel; capesize and all bulk carriers under capesize. In addition, the requirements for capesize bulk carriers were then divided to indicate different requirements for annual, intermediate and special survey. Regarding the amendments for acceptable means of access, it was agreed upon by the Project team that hydraulic arm vehicles, boats or rafts, and portable ladders for bulk carriers less than capesize, should be added to the list of equipment for means of access. The Project Team representative at the Fall Survey Panel meeting from BV, presented the project team proposals to the Panel, which after some editorial changes, unanimously agreed to the proposed amendments to URZ10.2 section 5.3.2.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose 1 January 2007 as an implementation date.

Submitted by Survey Panel Chairman
2 Nov 2005

Permsec's Note

1. LR sought confirmation from the Survey Panel as to whether these amendments did not go against SOLAS regulation II-1/3-6 and TP and IACS UIs and MSC Circular. LR added that Bulk carriers being built today would have Access Manuals which would define means of access for close-up surveys approved by ROs on behalf of Administrations.

2. It was then confirmed that the Survey Panel's proposal was consistent with all IMO and IACS requirements and recommendations except that for capesize and above, it limited the use of portable ladders. In that regard, ABS proposed an editorial modification to achieve consistent text with REC.91 and that REC.91 be revised to refer to the limitation of ladders introduced in 5.3.2 and 5.3.3 of UR Z10.2 (Rev.18). See REC 91, para. 5.6.1 (Rev.1, Nov 2005).

3. For reference, ABS' clarifications to the points raised by LR are attached (4110aABb, 16 Nov 2005).

4. Council discussion

4.1 Editorial nature:

Council approved the NK proposal to re-number the paragraphs 5.3.2~5.3.4, and to relocate references to "shell frames" / "hold frames" from the bulleted items to the chapeaux of the re-numbered paragraphs by referring to these cargo hold structural members as "cargo hold shell frames". This is consistent with the current text of Z10.2 which predominantly refers to these cargo hold structural members as "shell frames".

4.2 Substantive nature - para.5.3.4

4.2.1 NK's first proposal:

The following NK's proposed revision of paragraph 5.3.4 of Z10.2 did not achieve 3/4 majority support by Council Members.

> "5.3.4 For close-up surveys of the cargo hold shell frames of capesize bulk carriers (100,000 dwt and above), the use of *free standing* portable ladders *irrespective of their length*, is not accepted, and one or more of the following means for access, acceptable to the surveyor, is to be provided:"
>
> **Not adopted, Reason**: The introduction of "free standing" portable ladders is contrary to what GPG and the Survey Panel unanimously agreed with respect to prohibiting the use of any type of portable ladders (free standing, articulated, or otherwise) for close up surveys of cargo hold shell frames of bulk carriers (100k dwt and above). The text of the re-numbered paragraph 5.3.4 therefore remained without changes.

4.2.2 NK's 2nd proposal:

NKc offered a "compromise" proposal with a view to resolving this dilemma which would retain the original text of 5.3.4 but add a paragraph allowing the use of portable ladders fitted with a mechanical device to secure the upper end of the ladder only for Annual Survey of cargo hold shell frames of capesize bulk carriers

Under 5.3.4
Notwithstanding the above requirements, for close-up surveys of the cargo hold shell frames at Annual Survey, the use of portable ladder fitted with a mechanical device to secure the upper end of the ladder is accepted.

4.2.3 LR agreed but expressed the following view:

If the argument for limiting the use of ladders is still valid then there is a need to specify that their use is permitted only for "Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in the forward cargo hold", however "Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a Close-up Survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a Close-up survey of sufficient extent of all remaining cargo holds" the ladders should not be used and the hold should be staged.

LR's text was then modified by the Chairman to address the minimum extent of close-up survey of frames of capesize bulkers age 10 and older, at annual survey as required in 3.2.4 of UR Z10.2:

Under 5.3.4:
Notwithstanding the above requirements, the use of a portable ladder fitted with a mechanical device to secure the upper end of the ladder is acceptable for the "*close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating of the forward cargo hold*" at Annual Survey, required in 3.2.4.1.b, and the "*one other selected cargo hold*" required in 3.2.4.2.b.

Adopted on 10 Feb 2006.

Attached: ABS' clarifications to the points raised by LR are attached (4110aABb, 16 Nov 2005).

Subject: 4110aABb: Close-up surveys of bulk carrier hold frames, P/SU Task [4] (C50 FUA 7)

Date: 16 Nov 05

TO: Mr. Steven McIntyre, IACS GPG Chairman

CC: IACS GPG Members
CC: IACS Permanent Secretary: Mr. R. Leslie

FROM: S. R. McIntyre
File Ref: T-12-2

Subject: 4110aABb: Close-up surveys of bulk carrier hold frames, P/SU Task [4] (C50 FUA 7)

I note Kosta's LRb request to "*know the effect the proposed amendment will have on the designs already formally accepted to comply with SOLAS and IACS UI*" before giving final approval to the amendments. While the effect will only be known for each ship depending on the arrangement provided, I have the following comments to the numbered points Kosta raises:

3. I do not consider that a "*significant impact*" will result if IACS limits the use of portable ladders > 5m in length, since use of these ladders would otherwise greatly increase the time to survey, gauge and, if necessary, repair the side shell relative to employing other alternatives (e.g., cherry pickers). While the owner would have paid for these ladders based on RO's approval, the proposed UR would limit their use for survey only and these ladders are still available for use by the crew (which is included in the objectives of the TP's) to carry out maintenance and inspection.

4. Until such time that the TP's, MSC/Circ.1176 and/or the UI SC 191 are revised, ABS will ensure that those responsible for approving the SSAS are aware of the more limited choice of alternative means of access for capesize bulk carriers as per draft provisions of UR Z10.2.

4.1 The draft proposals for Z10.2 do not address, and therefore allow, the use of portable ladders > 5 m in spaces other than cargo holds.

Regards,
S. R. McIntyre
ABS IACS GPG Member

Survey Panel Task 37 – Amend UR Z10.2 to increase the scope of the survey requirements of Special Survey No.2 and the Intermediate Survey between Special Survey No. 2 and No.3 for Cape Size Bulk Carriers
Technical Background Document
UR Z10.2
(Rev.21, May 2006)

1. Objective:

Amend UR Z10.2 to increase the scope of the survey requirements of Special Survey No.2 and the Intermediate Survey between Special Survey No. 2 and No.3 for Cape Size Bulk Carriers

2. Background

The project team from Survey Panel Task 4, which dealt with amending the close-up surveys of bulk carrier hold frames, recommended to the Survey Panel at the Fall 2005 meeting that the Survey Panel should be tasked to amend the relevant sections of UR Z10.2 to increase the scope of requirements for Cape size bulk carriers because of the intermediate survey between SS No2 and & 3 is more critical than Special survey no.2 in respect of the close-up survey of hold frames.

3. Discussion

The member from NK proposed the following:
NK does not agree with the draft amendments of special survey No.2 in IAb which are completely same as the requirements of special survey No.3.
There should be some difference between the requirements of special survey No.2and No.3 because the requirements in the Table I are become stricter as ships become older.
NK proposed to reduce "one other selected cargo hold" from the draft.
All members agreed to the proposal from NK, with further minor amendments from RINA and BV, which was agreed upon unanimously by Panel members at the Spring 2006 meeting.

4. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules/procedures. Assuming that GPG and Council approve the amendments, the Survey Panel would propose **July 2007** as an implementation date.

Submitted by Survey Panel Chairman

Survey Panel Task 43 – Amend the applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

Technical Background

(UR Z10.2, Rev.22, June 2006)
(UR Z10.4, Rev.4, June 2006)
(UR Z10.5, Rev.4, June 2006)

1. **Objective**

Amend applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

2. **Background**

Due to the different application of substantial corrosion in the CSR from the current Unified Requirements.

3. **Methodology of Work**

Panel members discussed the proposed revisions through correspondence up to the Spring Panel meeting where final amendments were agreed upon for submittal to the IACS Hull Panel for review.

4. **Discussion**

After much discussion between all Panel members at the March 2006 Survey Panel members, a unanimous decision was reached as to the wording of CSR Substantial corrosion in UR Z10.2, 10.4, and 10.5 in section 1.2.9 and was then submitted to the Hull Panel for review and approval. The hull panel concluded that the Survey Panel definition for CSR substantial corrosion was not entirely accurate and recommended further amendments to clarify the actual requirements. The new definition was then circulated to the Survey Panel for a final review and was unanimously agreed upon.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules/procedures. Assuming that GPG and Council approve the amendments, the Survey Panel would propose **July 2007 as** an implementation date.

Submitted by Survey Panel Chairman

Technical Background

UR Z10.1 (Rev.14), UR Z10.2 (Rev.23), UR Z10.4 (Rev.5) & UR Z10.5 (Rev.5)

Survey Panel Task 3 – Maintenance of Alignment/ Compatibility of IACS URs and IMO survey requirements

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements regarding resolution MSC 197(80) – amendments to A744(18)

2. **Background**

IMO survey requirements to ESP vessels as amended in A744(18) as noted in MSC 197(80), with an implementation date of 1 January 2007.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel members, at the fall 2006 Survey Panel meeting, finalized the amendments to the applicable URs due to changes adopted at MSC(80).
Additionally, Members noted that URZ10.4 paragraphs 2.2.3.1 and 4.2.2.2 does not require examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80). The survey panel agreed that if this is the position that IACS would like to take regarding double hull tankers, then it should be brought to the attention of IMO at the next IMO meeting, DE50 in March 2007.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve the amendments, the Survey Panel would propose January 2008 as an implementation date, although the IMO implementation date is January 2007.

Submitted by Survey Panel Chairman
9 January 2007

GPG discussion

All members agreed to omit the requirement of examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80), from URZ10.4 for double hull tankers and

that it should be brought to the attention of IMO at DE50. In addition ABS proposed that paragraphs relating to similar requirements in URZ10.1 should also be deleted for consistency and this was agreed by members.

Members also made a number of minor/editorial corrections to the text prior to their approval of the revised documents.

Added by Permanent Secretariat
23 April 2007

Technical Background Document

UR Z10.5 (Rev.6 April 2007) & UR Z10.2 (Rev.24 April 2007)

(Survey Panel Task 10 – Develop survey requirements for void spaces of ore carriers)

1. Objective:
Develop survey requirements for void spaces of ore carriers

2. Background
DNV requested at WP/SRC Annual meeting October 2004 to develop survey requirements void spaces of ore carriers. See the attached document « Ore Carriers, Hull Survey Requirements » for easy reference.
NK submitted a « A case study on a certain Ore Carrier » dated 22 October 2004 for this purpose.

3. Discussion
The task has been carried out by a Project Team chaired by DNV Survey Panel member and with Survey Panel members from BV, LR, NK and RINA.

The Project Team drafted new amendments to Unified Requirement UR Z 10.5 « Hull Surveys of Double Skin Bulk Carriers » using the same principles contained in the survey requirements of UR Z10.1 for ballast spaces of single hull oil tankers with appropriate adjustments recognizing that void spaces do not carry ballast water.

In that respect, a new TABLE I/Sheet 2 was developed to cover the minimum requirements for close-up surveys at special hull surveys of ore carriers. The existing TABLE I, renamed TABLE I/Sheet 1, was made applicable to double skin bulk carriers excluding ore carriers.

Accordingly, TABLE III/Sheet 3 (REQUIREMENTS FOR EXTENT OF THICKNESS MEASUREMENTS AT THOSE AREAS OF SUBSTANTIAL CORROSION OF DOUBLE SKIN BULK CARRIERS WITHIN THE CARGO LENGTH AREA) was renamed STRUCTURE IN DOUBLE SIDE SPACES OF DOUBLE SKIN BULK CARRIERS INCLUDING WING VOID SPACES OF ORE CARRIERS.

In addition, Sheets 15 and 16 of URZ10.2 Annex II are to be removed.

The draft amendments to UR Z10.5 were presented to the Survey Panel members on the 13th-15th September 2006 meeting at ABS Headquarters in Houston and were finally agreed by all members on the 22nd September 2006.

4. Implementation
The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class Rules/procedures. Assuming that GPG and Council approve the amendments by the end of 2006, the Survey Panel would propose as an implementation date for surveys commenced on or after the **1 July 2008**

Submitted by Survey Panel Chairman
22nd March 2007

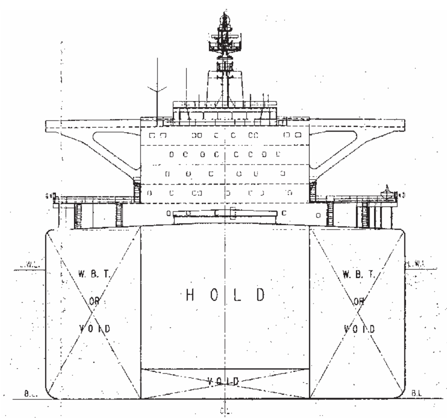
<u>Permsec note (May 2007):</u>
Revisions adopted by GPG 12 April 2007 (5031hIGg).

Attachment:

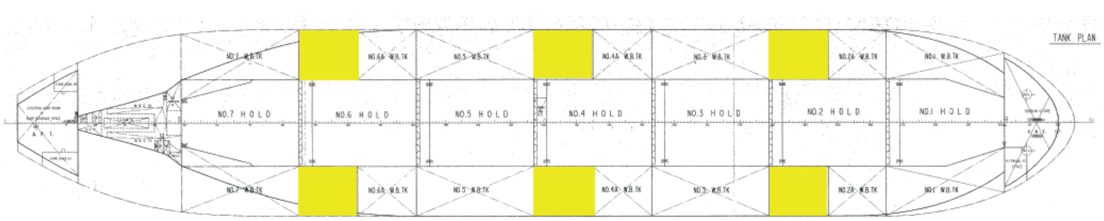
Ore Carriers, Hull Survey Requirements

"Ore carrier" means a single deck ship having two longitudinal bulkheads and a double bottom throughout the cargo region and intended for the carriage of ore cargoes in the centre holds only. Side tanks are generally arranged for the carriage of water ballast.

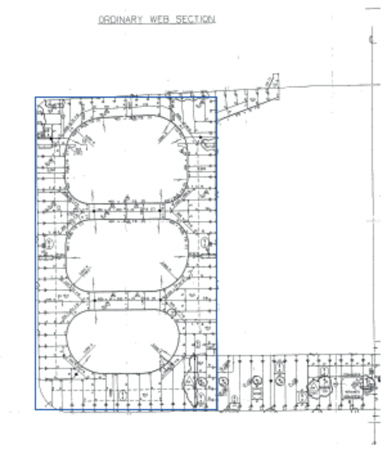
In accordance with UR Z10.5, for close-up surveys of side ballast tanks of ore carriers, the survey requirements of side ballast tanks for oil tankers as given in UR Z10.1 apply.



However, the amount of ballast water required to meet draught requirements for navigation / harbour operations, are generally less than the total capacity of the side tanks.
Hence ore carriers are often designed with several side tanks as void spaces.



The internal structures are generally as for side ballast tanks with transverse web frame rings. The protective coating, if any, may be less durable than coating applied for ballast tanks and the void spaces are exposed to corrosion.



Ore carriers are generally large sized vessels and the overall survey of side void spaces may not be sufficient in order to carry out a meaningful survey for detection of corrosion and other structural defects.

It is proposed to consider minimum requirements for close-up surveys for side void spaces. Requirements given in UR Z10.1 applicable to side cargo tanks may be used as basis.

DNV 2004-10-19

Technical Background

UR Z10.2, Rev.25 (July 2007)
Amendments to 5.3.3 , 5.3.4 and Table 1

(Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions)

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements

2. **Background**

This proposed change was raised by the ABS member from the Survey Panel, due to questions raised by industry.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**
Due to the many different interpretations of what size a Cape size bulk carrier is, the wording "Cape Size' is proposed to be removed and replaced with "….100,000 dwt and above.", to make the additional requirements very clear, regarding applicability.
All members of the Survey Panel unanimously agreed to this proposed change.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose July 2008 as an implementation date.

Submitted by Survey Panel Chairman
22 June 2007

Permanent Secretariat note (July 2007):
Adopted by GPG with an implementation date of 1 July 2008 on 19 July 2007 (ref. 5031kIGd).

Technical Background

URs Z7(Rev.15), Z7.1(Rev.5), Z7.2(Rev.1), Z10.1(Rev.15), Z10.2(Rev.26), Z10.3(Rev. 9), Z10.4(Rev.6), Z10.5(Rev.8) – November 2007

Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions

1. Objective

To review IACS Resolutions annually and discuss or propose amendments as deemed necessary.

2. Background

This proposed amendment to all URZ7s and URZ 10s was raised by the Panel member from DNV due to Owners crediting tanks concurrently under intermediate and special survey.

3. Methodology of Work

Survey Panel members through correspondence.

4. Discussion

The Panel member from DNV raised the issue of Owners having the ability of crediting spaces and thickness measurements only once in a 54 month interval, due to the availability of concurrent crediting of spaces and thickness measurements due to the flexible time window that is currently allowed between the intermediate survey and the special survey.
After a presentation and discussion lead by the DNV Panel member, all Survey Panel members agreed to the argument given by DNV, and further agreed to make the necessary changes in all URZ7s and URZ10s where Owners are not allowed to concurrently credit surveys and thickness measurements of spaces.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG approve to the amendments, the Survey Panel would propose January 2009 as an implementation date.

Submitted by Survey Panel Chairman
22 October 2007

Permanent Secretariat note (December 2007):

During GPG discussion DNV proposed that *"since this matter will be discussed between Owner and Class mainly in connection with the forthcoming Special Survey, DNV would prefer to locate this text, not only as part of Intermediate Survey, but also as a new text for the Special Survey."* This was supported by BV, ABS, RINA and KR.

The revised documents were approved, with DNV's proposal and an implementation date of 1 January 2009, on 15 November 2007 (ref. 7690_IGb).

Technical Background

URs Z7(Rev.16), Z7.1(Rev.6), Z7.2(Rev.2), Z10.1(Rev.16), Z10.2(Rev.27), Z10.3(Rev.11), Z10.4(Rev.7) and Z10.5(Rev.9) - March 2009

Survey Panel Task 62:

A) Harmonization of UR Z10.1, Z10.2, Z10.4 and Z10.5 with UR Z10.3 with respect to items 5.5.4.4 and 5.6.2.

B) Harmonization of UR Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 with UR Z7.2 with respect to the definition of the corrosion prevention system and with respect to the footnote 1 related to semi-hard coatings.

C) Harmonization of the definition of Ballast Tank in UR Z7(Rev.14)

1. Objective

A) Amend the texts of items 5.5.4.4 and 5.6.2 in Unified Requirements Z10.1, Z10.2, Z10.4 and Z10.5 in order to align them with those in UR Z10.3, in which they were changed while performing Task 55, whereas in the other UR Z10s they were kept unchanged on the grounds that this change was out of the scope of Task 55.

B) Amend the definition of "Corrosion Prevention System" and include a Footnote 1 related to semi-hard coatings in Unified Requirements Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 in order to align them with those adopted in UR Z7.2, when this new UR was issued.

C) Amend UR Z7 (Rev. 14) in all items where the term "Ballast Tank" is used in order to get them harmonized with the definition itself.

2. Background

The task, as regards item A), was triggered by a Member Society, while performing Task 55, on the grounds that this part was out of the scope of the task and then should have been dealt with in a separate task.
The task, as regards item B), was triggered as a consequence of the "New Business action item 2" of the Minutes of the September 2008 Survey Panel meting, for sake of harmonization of the various URZs.
The task, as regards item C), was triggered as a consequence of the "Task 54-Examination of Double Bottom Ballast Tanks at annual surveys" of the Minutes of March 2008 Survey Panel meeting, for sake of harmonization of the definition of Ballast Tank in UR Z7(Rev.14).

3. Discussion

The task was carried out by correspondence. All the amended texts for the affected URs were prepared by the Survey Panel Member who had chaired the PT on Task 55, in accordance with the Form A approved by GPG. In addition to the objectives outlined in the Form A, an amendment was added to item 1.3.1 of UR Z10.2 and UR Z10.5 in which the reference 3.2.3.6 in the last item of the list was replaced by 3.2.3.10 as can be correctly verified in the text.
The amended URs were circulated to all Survey Panel Members for review, comments and agreement. The texts of the URs were unanimously agreed by all Members.

4. Implementation

The Survey Panel is of the view that the Member Societies need at least 12 months from the adoption date to implement these amendments into their class rules/procedures. Therefore, in the first version of all amended URs the following implementation sentence should be proposed:

Changes introduced in Rev .xx are to be uniformly applied by Member Societies and Associates for surveys commenced on or after [not less than 12 months after the adoption by GPG/Council].

Since it is common practice and convenience to have implementation dates either on 1st January or on 1st July of the year, the Survey Panel proposes the 1st July 2010 as implementation date, if GPG/Council approve the URs not later than 30 June 2009.

Submitted by Survey Panel Chairman
28 February 2009

Permanent Secretariat notes (April 2009):

1. The amended URs were approved by GPG on 18 March 2009 (ref. 7718bIGd).
2. During the typesetting process it was noted that para 5.1.5 of UR 7.2 was inconsistent with the amended URs and so following consultation with the Survey Panel this was also amended at this time.
3. Regarding the implementation date, GPG agreed to use 1st July 2010 provided that it was consistently used for the amended URs.

Technical Background for UR Z10.2 Rev.28 (Mar 2011)

1. Scope and objectives

1) To amend UR Z10.2 to harmonize the definition of transverse section.

2) Update of references in the Executive Hull Summary Table VII.

3) Correction of "minimum allowable diminution" to "maximum allowable diminution" in Annex II.

4) Review IACS URZ10.2 to determine if there are issues which need to be addressed to ensure that the IACS survey regime and the CSRs are compatible.

2. Engineering background for technical basis and rationale

1) Based on that fact that bulk carriers and oil tankers have a transverse framing system applied for example on ship's sides etc. and that UR Z7 is applied to all types of ships and includes an extended definition of transverse section it is necessary to unify this definition in UR Z10s.

2) Update of references in the Executive Hull Summary Table VII such that the introduction of extended annual surveys is noted in the 'Memoranda' section rather than under 'Conditions of Class'.

3) Correction of "minimum allowable diminution" to "maximum allowable diminution" in Annex II to be consistent with the other UR Z10s.

4) Some requirements in CSRs for Bulk Carriers were relevant to ships in operation and it was decided to move them from CSRs to UR 10.2 in more consistent way.

3. Source/derivation of the proposed IACS Resolution

CSRs, IACS UR Z7 and other UR Z10s.
Proposed amendments to UR Z10.2 is based on internal discussion of IACS which is always striving to produce consistent and compatible rule requirements.

4. Summary of Changes intended for the revised Resolution:

1) The following additional text is added to the definition of transverse section in para 1.2.7:

"For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections."

2) In the Executive Hull Summary Table VII (iv) the reference to part G) is updated to part H) as per Table VII (ii).

3) The wording "minimum allowable diminution" is corrected to "maximum allowable diminution" in Annex II

4) The main amendment has consisted in removing the requirements found in the CSRs related to surveys after construction and locating them in the applicable sections of UR Z10.2. The rationale of that is to have only one place where survey requirements are given and avoid any duplication of requirements in different documents, which would give rise to problems of maintenance and alignment.

Another important amendment has been the requirement for annual examination of the identified substantial corrosion areas for bulk carriers. One Member Society was of the opinion that there should be no difference between the CSRs and non-CSRs bulk carriers. The other Member Societies were of the opinion to consider an alternative examination, which was the original requirement in CSRs, and thus the following text was adopted in UR Z10.2:

"For vessel built under IACS Common Structural Rules, the identified substantial corrosion areas may be:
a) protected by coating applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in good condition, or alternatively
b) required to be gauged at annual intervals."

Other important amendments have been made moving the following items from the CSRs to UR Z10.2 as applicable:
a) the paragraphs regarding the different corrosion patterns, such as pitting corrosion, edge corrosion and grooving corrosion, and their different acceptance criteria,
b) the items regarding the number and locations of thickness measurements, together with the associated table and referenced figures.

Another notable change has been introduced in the "ANNEX II - Recommended Procedures for Thickness Measurements" of UR Z10.2, which, however, are only recommendatory and not mandatory, where thickness measurements forms specific to CSRs single skin bulk carriers have been produced in addition to the existing ones, which only apply to non-CSRs ships.

Finally, for CSRs bulk carriers the requirement has been introduced which stipulates that "the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the special surveys carried out after the ship reached 15 years of age (or during the special survey no. 3, if this is carried out before the ship reaches 15 years) in accordance with the criteria for longitudinal strength of the ship's hull girder for CSRs bulk carriers specified in Ch 13 of CSRs".

5. Points of discussions or possible discussions

See item 4 above.

6. Attachments if any

None.

Technical Background for UR Z10.2 Rev.29, July 2011

1. Scope and objectives

Review the requirement for repairs within IACS UR 7 and UR 10 series, in particular the requirement for Prompt and Thorough Repair, with a view to developing wording that would permit a temporary repair and the imposition of a Recommendation/ Condition of Class under specific and controlled circumstances, and in accordance with PR35.

2. Engineering background for technical basis and rationale

There are instances, for example a localised, isolated and very minor hole in a cross-deck strip, at which a suitable temporary repair, for example by welding or doubling, and the imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date, are considered very adequate methodology for dealing with the defect.

Current IACS Requirements in the UR Z7 and Z10 series, for Prompt and Thorough repair, would not permit this to be an option, the defect would have to be permanently Promptly and Thoroughly repaired, which might require removing cargo, moving to a repair berth and staging inner spaces.

Under the Requirements of IACS Procedural Requirement PR 35 the methodology of Temporary Repair and imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date is fully permissible.

3. Source/derivation of the proposed IACS Resolution

Based upon discussion within the IACS Survey Panel.

4. Summary of Changes intended for the revised Resolution:

Following the definition of Prompt and Thorough Repair in the Unified Requirement, a new paragraph is proposed to be added:-

“1.3.3 Where the damage found on structure mentioned in Para. 1.3.1 is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the surveyor to allow an appropriate temporary repair to restore watertight or weather tight integrity and impose a Recommendation/Condition of Class in accordance with IACS PR 35, with a specific time limit.”

5. Points of discussions or possible discussions

a) The points of discussion are as indicated in Sections 2 and 4 above.

b) Discussion took place on whether to prepare this amendment as a Unified Interpretation of IMO Resolution A.744(18)/UR Z7 and Z10 series, finally it was agreed to make direct amendment to the relevant URs.

c) It is proposed that this amendment be submitted directly to the IMO DE/MSC Committees for consideration of amending directly IMO Res. A744(18)

6. Attachments if any

None

Technical Background for UR Z10.2 Rev.31, Jan 2014

1. Scope and objectives

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.
b) To align the requirements in PR37 and UR Z10s regarding safe entry to confined spaces.

2. Engineering background for technical basis and rationale

a) As per the IMO Res. A1053 (27), lengthy conversions (not necessarily of major character) or other major repair work can be assigned for a 5 year period from the date of completion of conversion/repairs/surveys.
b) Safety requirements in IACS PR37 can be applied to carry out survey in safe way for all kind of ships. When there are no indications about the safety of surveyor in UR Z10s then the requirements in PR37 shall be applied.

3. Source/derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

a) Following additional text was included to section 2.1.3 to clarify the class period for lengthy conversions

"In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date."

b) Existing Section 5.2.6 and 5.2.7 were deleted from UR Z10s since provisions of these sections were covered by PR37. Reference of PR37 was included in Section 5.2.1.1.

5. Points of discussions or possible discussions

i) Additional text to Para.2.1.3 was discussed in order to clarify class period.
ii) Panel considered that safety of surveyors should be dealt by PR37.

6. Attachments if any

None

Technical Background Document

UR Z10.2 – Revision 10
For ExCM decisions

Objective and Scope:

Revise UR Z10.2 to introduce ExCM (Extraordinary Council Meeting in Feb 2000) decision to UR Z10's

- ExCM FUA 2-2: Intermediate surveys of ships subject to ESP, which are over 15 years of age, will be enhanced to the scope of the preceding special survey with dry docking or under water survey as applicable.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC Chairman, shortly after GPG 48th meeting:

- The para. 4.2.2, 4.2.3 & 4.2.4 for ExCM FUA 2-2.
- For the outcome of WP/SRC Task 49 "application of Z10.2 to ore carriers), the para. 4.2 was re-arranged.
- The paragraph 8.2.1 for compatibility with the PR 19 (ABS GPG suggested.)
-

Points of Discussion:

GPG 48 meeting discussed whether to extend the requirement of ExCM FUA 2-1 to other ships and C 41 confirmed not to extend this requirement to other ships for the time being.

- **-** ExCM FUA 2-1: All ballast tanks adjacent to cargo tanks with heating coils shall be examined internally on an annual basis after the ship has reached 15 years of age.

Unresolved Comments:

-

Discussions:

In addition, LR (GPG) proposed the following additions:

- The second half of the para. 4.2.4.1(LR)

  "except that testing of cargo and ballast tanks is not required unless deemed necessary by the attending surveyor."

  The majority GPG agreed.

- The paragraph 7.1.1 of Z10.1 and Z10.3, paragraph 8.1.2 of Z10.3 were revised for their compatibility with the PR 19 "PR for Thickness Measurement".

Submitted by the Permsec
On 18 Sept 2000

Technical Background Document
WP/SRC Task 49
UR Z10.2 – Proposed Draft Revision 10
(submitted by WP/SRC Chair on 10 June 2000)

Objective and Scope:

Review UR Z10.2 for the purpose of verifying that it also fully applies to Ore Carriers as defined in UR Z11.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC Members, through correspondence and their meeting, identifying the requirements contained in Z 10.1 for Oil/Ore Carriers and incorporating them into UR Z10.2.

Points of Discussion:

WP/SRC did not unanimously agreed to either of two draft UR's submitted with this document.(Z102.doc and Z102strict.doc)

Unresolved Comments:

WP/SRC agree to the changes in 4.2.1.1 and 4.2.2.5 with the exception of the requirement for close-up survey of Web Frame Rings in Ballast Wing Tanks for vessels ≥ 15 years of age.

Seven of the Members agreed to require that All Web Frame Rings in All Ballast Wing Tanks should be close-up surveyed.

Three of the Members did not agree, but did agree to require All Web Frame Rings in One (1) Ballast Wing Tank and One (1) Web Frame Wing in all remaining Ballast Wing Tanks be close-up surveyed.

Discussions:

The Members that did agree to require that All Web Frame Rings in All Ballast Wing Tanks should be close-up surveyed, based the decision to remain consistent with the principal adopted in Z10.1 for Oil Tankers and Oil/Ore Carriers. LR and DNV were vocal in their opposition to the less strict requirements supported by BV, RINA, and KR.

The Chairman requested reasons for the opposition to the stricter requirements from the three Members for inclusion in this document and are as follows:

BV - When the ships in caption have 5 ballast tanks each side that means in that case they have 10 ballast tanks in total + peaks. considering 4 web rings per tanks gives in 40 web rings. If the ship's depth is 18 m and tanks' breath 10 m the developed length of a web ring is 56 m considering the 40 web rings we will have to close-up examine 56x40= 2240m. considering the scaffoldings to be erected, the physical condition requested to the attending Surveyor(s) and the other items to be inspected, it will be simply impossible to comply with the requirements (which will correspond more or less to a Special Survey) during an intermediate survey. Unless we reduce the class term to 3 years, I do not agree with the proposals.

RINA - RINA is of the opinion that requiring the close-up survey of all web frame rings in all ballast tanks (wing tanks + peak tanks) at the intermediate survey of ore carriers of 15 years of age and over is excessive and not reasonable as the assessment of these tanks can be achieved likewise through the overall survey in all of them and the close-up survey of "ALL web frame rings in ONE ballast wing tank and ONE web frame ring in EACH REMAINING ballast wing tank" and, in any case, should the condition of the web frame rings inspected be found not satisfactory, the survey will have to be extended to other rings in the same tank, as suggested in my message of 15 April. This less strict scope of survey would allow intermediate survey to be feasible and compatible with the commercial operations of ships (in fact these surveys are usually carried out either during loading and unloading phases or at the end of them and require extensive scaffolding to be erected or rafting to be carried out). In addition, experience in performing intermediate surveys of ore/oil carriers for which the same stricter requirements have already been implemented has proved how it is difficult for a surveyor to have these spaces adequately prepared for this kind of inspection. Thus we do not like to extend the same problem to other kinds of ships and, rather, would like to amend the corresponding requirements related to ore/oil carriers accordingly, although it is recognized that this proposal could be difficult to achieve. Anyhow, even if the majority decides to submit the original text to GPG, we are prepared to maintain our position.

KR - The requirements of close-up survey of "all web frame rings in all salt water wing ballast tanks" at intermediate survey for ships older than 15 years is considered too heavy because all transverse webs in each ballast tank were close-up surveyed already at special survey No.3 as indicated in table 1 of existing UR Z10.2.

Note of IACS Permanent Secretariat (Date: 19 July 2000)

1. Numbering of the paragraph 4.2 of Z10.2 was re-arranged due to introduction of the requirements addressing ExCM FUA 2-2 “enhancement of intermediate survey to the preceding special survey for ships over 15 years of age.

2. The WP/SRC’s proposed change to the para. 4.2.2.5 (now it stands as para. 4.2.3.1.b)) invited diverging views among GPG Members. However, it was found at GPG 48 meeting in March 2000 that the ExCM decision relating to enhancement of intermediate survey should be taken into account and as a result an urgent task was given to WP/SRC Chairman during GPG 48 to re-draft this paragraph.

   (The para. 4.2.2.5 (now 4.2.3.1.b): the extent of close-up survey of ballast tanks at intermediate survey in ore carriers over 15 years of age.)

3. WP/SRC Chairman put forward a re-draft of this requirement in April 2000.

4. GPG Chairman announced unanimous agreement on 14 August 2000 (0065aIGd, 14/8/00).

Technical Background Document
WP/SRC Task 62
UR Z10.2 – Proposed Draft Revision 10
(submitted by WP/SRC Chair on 10 June 2000)

Objective and Scope:

Revise UR Z10.2 detailing how intermediate surveys are to be applied annually to the foremost cargo holds of ships subject to SOLAS XII/9.1. Also, draft comparable amendments to A.744(18) for consideration by GPG with a view to their submission to IMO.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC members through correspondence and their meeting by incorporating the requirements of SOLAS XII/9.1 into UR Z10.2 and A.744(18).

Points of Discussion:

WP/SRC unanimously agreed to the draft UR.

(Note: After adoption of Z10.2 (Rev.10), amendment was made to it in order to avoid conflict between WP/SRC Task 62 and ExCM decision to extend the scope of intermediate survey of older bulkers to that of special survey. See the Rev. 10.1 of Z 10.2 (3 October 2000, note by the Permsec))

Submitted by the Permsec
On 18 Sept 2000

Technical Background Document

UR Z10.2 – Revision 10.1
For WP/SRC Task No. 62

Objective and Scope:

Revise UR Z10.2 (Rev.10) to keep the original intention that for the foremost cargo hold of the ships subject to SOLAS XII/9.1, intermediate surveys shall apply.

Source of Proposed Requirements:

- The outcome of WP/SRC Task 62.

Points of Discussion:

The consequence of Council's decision to extend the scope of intermediate surveys of older bulkers to that of special survey has the effect of making the annual survey required by 3.2.1.2 be a special survey (i.e. a full special hull survey every year for bulk carriers subject to SOLAS XII/9.1).

<u>See the note 5, para. 3.3 and new Annex IV.</u>

Submitted by the Permsec
On 3 Oct 2000

Technical Background Document
WP/SRC Task 77
UR Z7 – Proposed Draft Revision 7
(Including Rev.8 of Z10.1, Rev.11 of Z10.2, Rev.4 of Z10.3)

Objective and Scope:

Extend the requirements for permanent repairs at the time of survey in UR Z 10.2 to all ships.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC members through correspondence and discussions at the September 2000 meeting.

Points of Discussion:

UR Z7 was amended to apply "prompt and thorough" repairs to all vessels. The new wording defines a prompt and thorough repair to be a repair as a result of wastage and not an incident such as contact damage where a temporary repair or deferral of repairs could be permitted. This wording is more explicit than the wording in UR Z10.2 and should achieve a uniform application among the Members.

WP/SRC also agreed to include these requirements in Z10.1, Z10.2 and Z10.3 in order to not effect A.744(18).

WP/SRC unanimously agreed to the draft UR.

Note by Permsec

GPG 49 (11-13 Oct. 2000) agreed that the same changes be introduced to Z10's and carried out editorial review of Z 10's.

Technical Background for

Rev.8.1, Z10.1

Rev.11.1, Z10.2

Rev.4.1, Z10.3

(21 June 2001)

1. Scope of objectives

Revise section 2.3.1 for clarity.

2. Points of discussions or possible discussions

- BV GPG member proposed to revise section 2.3.1 of Z10s on 12 June 2001 (0065j)

- IACS Council considered the ambiguity of the sentence in Special Survey section 2.3.1 “For Fuel Oil Tanks the necessity for the Overall Survey is to be determined based on the ship’s age” in the context of its application at intermediate surveys on ships over 15 years. Council agreed that the overall survey of low corrosion risk tanks such as fuel oil, lube oil and fresh water tanks could be subject to special consideration as already addressed in section 2.2.5 of UR Z7 and therefore amended the first sentence of 2.3.1, accordingly, and deleted the last sentence of 2.3.1.

- Adopted on 21 June 2001.

Technical Background Document
WP/SRC Task 87
Amend Z10.1&10.2 to reflect changes introduced to Res A.744 by MSC 73
(Z10.1, Rev.9) + (Z10.2, Rev.12) + (Z10.3, Rev.5)

Objective and Scope:

To harmonise IACS UR Z10.1 and Z10.2 with IMO Res A744(18), as previously amended and as amended by IMO MSC105(73) and MSC 108(73).
These amendments enter into force 1 July 2002.
It was assumed by WP/SRC that the intention of GPG has been to revise UR Z10.3 (chemical tankers) as well with respect to the intermediate dry-docking requirement, but not to include the requirement to evaluation of longitudinal strength.
In addition, the relevant changes to UR Z10.1 based on the changes introduced in IMO Res A744(18) as reported in MSC 74/24/Add1-Annex 17 have been included. These were based on IACS submission DE 44/13/1. These amendments will enter into force 1 January 2004 subject to IMO tacit acceptance procedures.

POINTS OF DISCUSSION:

The Chairman of WP/SRC would further draw GPG's attention to paragraph 4.2.4.3, which contains the requirement to intermediate dry-docking for oil tankers exceeding 15 years of age. The corresponding Res.A 744(18) requirement (paragraph 2.2.2) does not link the dry-docking to the intermediate survey. This issue was discussed extensively by correspondence and during three WP meetings this year. A consensus decision was achieved without reservations from any members. This process was time consuming, hence the delay in submitting this document to GPG for approval. However, at the annual meeting of the WP in October 2001 all members agreed that we should not accept the wording of Res. A 744(18) paragraph 2.2.2, but instead require that the intermediate dry-docking is to be linked to the intermediate survey and include a requirement to carry out surveys and thickness measurements of the lower portions of the tanks for oil tankers. (similarly, cargo holds/water ballast tanks for bulk carriers)

GPG is advised to note that the proposed requirement in paragraph 4.2.4.3 may result in a third dry-docking within the 5-year period of the classification certificate in case that a dry-docking is carried out prior to the window for intermediate survey.

The Chairman of WP/SRC suggests that GPG approves UR Z10.1 with high priority and allows PermSec in the meantime to start the work to amend and typeset UR Z10.2 and URZ10.3 with respect to the intermediate dry-docking requirement, as well as introducing the appropriate changes to UR Z10.2 and UR Z10.3 with respect to MSC 74/24/Add 1-Annex 17.

Note:

1. GPG tasked WP/SRC to review dry-docking survey requirements in Z10.2-4 and Z3 to harmonize them with those in Z10.1 (Rev.9) and reflect in Z3 the interim application of bottom survey requirements as introduced in MSC/Circ. 1013 (Res A.746(18)).

   Task 101, Target 2Q-2002

2. GPG confirmed (s/n 1060c) that 7.1.3 of A.744(MSC 74/12/Add.1/Annex 17/page 6), as quoted below, should not be included in Z10s.

   "7.1.3 Thickness measurements are to be carried out within 12 months prior to completion of the periodical survey or of the intermediate survey."

   Reason: The above sentence will restrict the 15 month and 18 month survey window for TM during the intermediate and special surveys respectively.

3. GPG confirmed that 7.1.4 of A.744(MSC 74/12/Add.1/Annex 17/page 6), as quoted below, should not be included in Z10s:

   "7.1.4 In all cases the extend of the thickness measurements should be sufficient as to represent the actual average condition."

   Reason: No compelling need, in view of MSC 74/12/Add.1 being adopted by MSC 75(May 02). IACS will live with this not harmonized sentence.

4. For IACS Council decisions to improve bulk carrier safety, see the TB for Revision 12 of Z10.2.

Submitted by WP/SRC Chairman

UR Z10.1(Rev.11) and Z10.2(Rev.14)

(July 2003)

Technical background

Part A: Survey Reporting Principles

1. Objective

WP/SRC Task 80 – Survey Reporting Principles

2. Points of discussion

The WP/SRC carried out this task according to the work specification of Form A (Rev.1) and reported the outcome on 18 December 2002 as follows:

- Review of NMD's report on "Sinking of Leros Strength", dated 6 July 2000 and the recommendations in section 5.3
- Review of IACS Council's reply, dated 22 August 2000 to those recommendations
- For recommendations 1.1, 1.2, 1.3 ,3, 4.2, 5 and 6, best practices have been identified by information exchange amongst Members and discussions at three WP-meetings.
- Harmonised survey reporting practices fulfilling, in so far as practicable, the recommendations of NMD have been included in the revised tables attached.
- Standard survey reporting terminology (recommendation 2) is in the process of being prepared and will be submitted to GPG for approval as an IACS Recommendation with the title "Surveyor's Glossary". The completion of the glossary has been delayed somewhat due to pending illustrations of typical hull structures.

Council approved on 14 July 2003 (2249_).

***

Part B: Incorporation of CAS related requirements into UR Z10s

2. Objective

WP/SRC Task 106 – Incorporation of CAS related requirements into A.744

2. Points of discussion

The WP/SRC carried out this task according to the work specification of Form A and reported the outcome on 27 May 2003.

- Since CAS was developed for tankers only, WP/SRC considered whether there is any need to further develop/modify requirements in CAS with respect to bulk carriers. Hence, amendments to Z10.15.5.5(rafting), 5.6(survey planning), 8.2.2(different survey stations) and Table 1(close-up survey).
- IACS will submit its proposed amendments to Res A.744 as a result of this revision.
- NK GPG suggested that the word "<u>alone</u>" be inserted after "rafting" in Z7 and Z10.1(5.5.5)~10.5.
    - WP/SRC had considered this and felt that the insertion of the word "alone" will create a loophole as the text "Rafting alone will only be allowed..." could be interpreted that other means of access have to be used. Besides this wording would impede the use of rafting for survey of side and bottom structures of the spaces.
    - GPG considered that rafts/boats should be accepted as a means to move about within a tank to gain access to any temporary platforms that may be erected. Consequently, the wording of 5.5.5 was re-drafted and split into three parts (5.5.5~5.5.7) beginning with "<u>*Rafts or boats alone may be allowed for inspection of the under deck areas…*</u>"

      The same wording will be introduced into Z10.3, Z10.4, Z10.5, Z7 and Z7.1.

Approved on 08/08/2003 (0237h)

Prepared by the Permanent Secretariat

22 July 2003

Technical Background

UR Z10.2 (Rev.15, Dec 2003)

1. Objective :

Develop criteria for the extent and methodology of thickness measurements of frames of single side skin bulk carriers so as to ensure that UR S31 and UR Z10.2 include consistent, accurate and sufficient requirements.

2. WP/SRC Task 111

WP/SRC Task 111 completed on 10 Nov 2003 with new report form on Thickness Measurements of Cargo Hold Frames.

In addition, WP/SRC proposed the following changes:

1) to enhance the close-up survey requirements of the shell frames at Special Survey No.3 to include all shell frames in the forward and one other selected cargo hold and 50 % of frames in each of the remaining cargo holds. GPG agreed.

2) ships which are required to comply with UR S31 are subject to the additional thickness measurement guidelines for the gauging of side shell frames and brackets as given in the proposed new Annex V. GPG agreed.

3. GPG Discussion

GPG agreed to the following further changes:

1) Annex V, item 3.1: further modified to indicate that the 5 deepest pits within the cleaned area be gauged and the minimum thickness found recorded;

2) WP/SRC's proposed paragraphs relevant to face plates in both items 4.1 and 4.2 of Annex V were deleted;

3) Gauging method on flange and shell plating for bending check was newly introduced as item 4.3 of Annex V.

WP/SRC Task 102
HARMONIZATION OF UR Z7s AND Z10s

Technical Background
UR Z7 (Rev. 11)
UR Z7.1 (Rev. 2)
UR Z10.1 (Rev. 12)
UR Z10.2 (Rev. 17)
UR Z10.3 (Rev. 7)
UR Z10.4 (Rev. 2)
UR Z10.5 (Rev. 1)

Contents:

1. Objective

To amend UR Z7s and Z10s in order to make the texts of the above-mentioned URs consistent eliminating all the differences both in substance and in wording (WP/SRC Task 102).

2. Background

In the process of approving UR Z10.4, GPG found it necessary to amend the other existing URs Z10.1, Z10.2, Z10.3, Z10.6 and Z7 in order to eliminate any inconsistencies existing among them.

3. Methodology of work

The WP has progressed its work through many sessions, both during the periodical meetings and dedicated meetings restricted to a Small Group of Members (BV, DNV, GL, LR, RINA) who developed the work in order to be more efficient. All the proposed amendments of the Small Group have regularly been circulated to all Members for comment and agreement.

4. Discussion

4.1 The WP/SRC has completed a comprehensive comparative review of UR Z7 and Z10s, and identified inconsistencies which existed among them. During this review, attention was given to the severity of the requirements applicable to the same spaces/structural areas on different types of ESP ships. As a result, the inconsistencies were eliminated making the URZs harmonized. However, there has been no change to the scope and extent of the survey requirements.

4.2 The starting point for each UR was the most updated version available at the time of commencement. Any revision to the URZs, which were introduced during this task, was taken into account. As for instance, the UR Z10.1 was initially amended based on Rev. 9, while the last amendments are based on Rev. 11 and the UR Z10.2 was initially amended based on Rev. 13, while the last amendments are based on Rev. 16. The proposed revisions of URs Z10.1 and Z10.4 have not been numbered, as there will be revisions to those URs before the revisions introduced by the Task 102 are adopted. In fact, GPG is currently developing a Revision 12 of Z10.1 with the view to introducing significant improvements in the survey regime for ballast tanks (including combined cargo/ballast tanks) of oil tankers and UR Z10s applicable to oil tankers will also have to be revised by incorporating the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005 (see 4.3 below).

4.3 Also, in harmonizing UR Z10.1 and Z10.2 care has been taken to align the corresponding text with that of IMO Res. A.744(18). However, it has been noted that the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005, have not been incorporated into the IACS UR Z10s applicable to oil tankers. It seems that the updating of the above-said UR Z10s will be done by the Perm Sec and reviewed by the WP/SRC Chairman and then circulated for adoption by GPG with concurrence of Council Members for uniform application from 1 January 2005. It is understood that the revisions of the UR Z10s affected by those amendments will not include the changes introduced by the Task 102, as the implementation date proposed for those changes is 1 January 2006 (see below **6. Implementation**).

4.4 In the course of the work the WP has been developing for more than two years, several additional Tasks were assigned to the WP by GPG which affected the development of Task 102. The additional tasks which have been taken into account are the following:

1) In the course of Council discussion on UR Z10.6 (General Cargo Ships), certain inconsistencies were identified between Z10.6 and other Z10s. WP was instructed to expedite Task 102 (1060gIAa, 12 June 2002);
2) WP was instructed to include “Survey Planning for Intermediate Survey” into harmonization work (2108_IAa, 12 July 2002);
3) GPG instructed WP to consider whether Z10.6 should be re-assigned as Z7.1, in connection with the harmonization work. 1060gIAb, 20 Sept 2002.

Z7.1 developed;

4) Partial outcome (Z7 and Z7.1) was submitted to GPG on 17 July 2003(1060g). Council decided that approval of Z7(Rev.10) and Z7.1(Rev.2) is postponed until the harmonization is completed (1060gICb, 6 April 2004);
Council Chairman instructed WP/SRC to Members' comments on the draft revision of UR Z7 and Z7.1 (collected under s/n 1060g, 1060gNKi (30/03/2004) in particular) on 6 April 2004.

5) GPG tasked WP to include the amendments to Z10.2 / Z11 (BCs with hybrid cargo hold arrangements), deleting sheets 15 and 16 for ore carriers, into the harmonized UR Z10s (2212aIGa, 19 Jan 2004);
6) GPG tasked WP to consider whether the requirements relevant to examination of Fuel Oil Tanks in the cargo area at each Special Survey should be put into Z 10s, and internal examination of FOT at Intermediate Survey after SS 2 is needed. (1060gIAf, 30 Jan 2004);
7) GPG tasked WP to harmonize tank testing requirements in Z7s and Z10s. (3006lIAa, 5 April 2004);
8) GPG tasked WP with Task 108 - Develop uniform survey requirements for air vent pipes including the welded connection to deck. Z22 developed. GPG instructed WP to incorporate Z22 into the harmonized Z10s;
9) GPG tasked WP with Task 114 - Verification and signature of TM reports. REC 77(Rev.1) developed and approved on 29 July 2004. Council approved parallel amendments to Z7.1 and Z10s (TM Forms included) and instructed WP to incorporate these into the harmonized Z10s:
    - Recommendation No.77 was revised (Rev.1, July 2004);
    - Z7.1 para.6.3.2 and Z10s para.7.3.2 so amended.
    - "Surveyor's signature" is deleted from all TM Forms in Z10s;
    - A note is added to Annex II(Z10s) declaring that Annex II is recommendatory.

   WP/SRC's investigation into Members' practice in dealing with verification and signature of TM reports is annexed for record keeping purpose. See Annex 2.

10) GPG tasked WP to consider the BV comments on "TM may be dispensed with…." and include the findings into the harmonized Z10s (2219iIAa, 7 April 2004).

5. Agreement within the WP/SRC

All Members have unanimously agreed the attached final versions of UR's.

6. Implementation

WP/SRC is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming Council adoption in December 2004, WP/SRC would propose January 2006 as implementation date.

Annex 1: TB for UR Z10.1(Rev.12, C49 amendments, see Permsec's note 1 below)
Annex 2: WP/SRC Task 114, verification and signature of TM reports(see 9 above).
Annex 3**:** TB for revision of UR Zs concerning "anodes".

Note by the Permanent Secretariat

1. Annex 1 to this TB contains background for amendments to UR Z 10.1(Rev.12) relating to FAIR/POOR/GOOD (C49 amendments). Council at its 49th meeting (June 2004) agreed/decided that comparable changes should be added to Z10.3 and Z10.4.

2. Appendix 3 "TM sampling method" has been added to UR Z10.1 and Z10.4 to keep them consistent with IMO Res.MSC.144(77). The amendments to A.744 contained in MSC.144(77) entered into force on 1 January 2005. *(GPG s/n 4181)*

Under s/n 4072g, paragraph **2.4.6** of UR Z10.1 and **2.4.6** and of UR Z10.4 (paragraph numbering is now harmonized) were amended in order to provide a link between the main text of the UR Z10.1 and 10.4 and the new Annex III Appendix 3 containing the MSC Res.144(77).

Further, it was agreed that the requirements for evaluation of longitudinal strength of the hull girder (as written in MSC.144(77)) should not be required for Intermediate Survey unless deemed necessary by the attending Surveyor. This is covered in 4.2.3.1 and 4.2.4.1 of Z10.1 and Z10.4.

3. GPG agreed that the amended UR Zs should be implemented from 1 July 2006 altogether.

4. DNV's proposed amendments to UR Z10.1, Z10.3 and Z10.4 concerning annual survey of ballast tanks were agreed by Council (1060gICq, 27 June 2005). See Appendix 2 to Annex 1.

5. Annex 3 contains a TB for revision of UR Zs concerning "anodes".

Date: September 2004
Prepared by the WP/SRC

– – –

Annex 1 to Technical Background
UR Z 10.1 (Rev.12, C49 amendments(coating-related))

1. Objective

To introduce significant improvements in the survey regime for ballast tanks (including combined/ballast tanks) of oil tankers as matter of strategic concern and urgency to IACS, given the aging of both the single and double hull tanker fleets and the problems encountered with corrosion of ballast tanks in several shipping casualties.

2. Background

Draft amendments to UR Z10.1 were submitted to Council 47 (June 2003) and agreed in principle.

3. Discussion

There was particular concern over accelerated corrosion with age (as the thinner the material, the more rapidly the allowable diminution margin percentage disappears) especially where coatings have broken down. There is also a disincentive for any spend on maintenance of the structure of a ship within a few years of its statutory scrapping date.

Council discussion by correspondence had evolved to the position of substantive proposals – summed as follows (3095_ABa, 2 June 2003):

1. Enhance the Intermediate Survey in Z10.1, Z10.3 and 10.4 for Tankers after 2nd Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey). This corresponds to the latest revision to UR Z10.2.
2. At Annual Survey of ballast tanks with substantial corrosion, the overall survey is to be replaced by close-up survey with thickness measurements of the exposed area.
3. Proposed to task WP/SRC to re-consider the acceptance criteria for the rating FAIR further. For this, eliminate FAIR, leaving only GOOD and POOR redefined as appropriate.
4. Proposed to task WP/SRC to explicitly require close-up survey of Suspect Areas identified at the previous Special Survey.

Council 47 discussed the proposals(June 2003) as follows:

1. Definition of FAIR
   Council 47 agreed that "FAIR" would be retained as a rating and that GPG should instruct WP/SRC to redefine FAIR, so that there would be a clear differences between FAIR, POOR and GOOD. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have the same scope as Special Survey No.2(Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

   Based on the strong majority, Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

   > *DNV and NK stated that they could not accept a requirement for annual surveys of ballast tanks when the coating condition is less*

than GOOD and proposed that GOOD be changed to FAIR (3095_IGc, 30 June 2003)

2. ABS' proposed amendments to Z10.1(annual examination of BWTs in certain conditions) were approved.
3. C 47 agreed that the BWT coating requirements (Z10.1.2.2.3) for intermediate Survey after SS 2 should be the same extent to the previous SS.
4. Given the substance of the changes, the revised Z10.1 should be shown to Industry before adoption.
5. A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.

Following Council 47, the draft text of Z10.1(Rev.12) was distributed to Industry and discussed at the IACS/Industry meeting on 29 August 2003. Industry indicated that UR Z10.1(Rev.12) is acceptable, provided that appropriate IACS guidelines on coating repairs are developed.

The Small Group on Coating (SG/Coating) under WP/SRC prepared draft guidelines on coating repairs and considered the definitions of GOOD / FAIR / POOR. The SG/Coating did not change the definitions and found that the Guidelines provide useful clarifications on the definitions and criteria in achieving an industry wide uniform judgement of coating conditions as well as what is needed to restore GOOD conditions.
Further, an IACS/Industry JWG/Corrosion was established and met in February 2004. The outcome is (3095_IGh, 4 June 2004):

- Draft Guidelines on Coating Repair (IACS REC 87)
- Draft UR Zxx (mandatory coating of cargo tanks on oil tankers)
- Draft UI SC 122 (Rev.2) – mandatory coating of ballast tanks

4. Others

1. Z10.11.2.2bis - Definition of "Combined Cargo/Ballast Tank. …as a routine part of the vessel's operation and will be treated as a Ballast Tank. ...". By so amending, Z10s do not need to repeat "Ballast Tanks *and Combined cargo/salt water Ballast Tanks*" in addressing the ballast tanks. Hence, all the references to "*and Combined cargo/salt water Ballast Tanks"* were deleted.
2. Z10.1.2.2.1.2: The aim of the examination is ~~to be sufficient~~ to discover substantial corrosion…
   Comparable changes are to be added to other UR Zs wherever the same sentence occurs.
3. "IACS Guidelines for Coating Maintenance & Repairs for Ballast Tanks and Combined/Ballast tanks on Oil Tankers" are referenced where relevant.
4. Comparable changes are to be added to UR Z10.3 and Z10.4, after adoption of Z10.1(Rev.12).

Attached: Memo on Coating Matters (GPG Chairman)

9 June 2004
Prepared by the Permsec

Appendix 1 to Annex 1: MEMO on Coating matters

1. Background and discussion within IACS on UR Z10.1 (draft Rev.12) between 29/01/03 and 14/08/03

In view of the survey experience with oil tankers, it was proposed that all ballast tanks should be examined, routinely and uniformly, at annual surveys on ESP tankers exceeding 15 years of age. IACS should amend UR Z10.1 to require the examination of ballast tanks on such ships at each annual survey. This is simple, clear and thorough and not subject to interpretation. (2242_ABq dated 29/1/03)

Then, ABS modified the proposal asking, for tankers subject to URs Z10.1, Z10.3 and Z10.4, exceeding 15 years of age, that the current requirement - pertaining to annual examination of Ballast Tanks adjacent to cargo tanks with any means of heating - be deleted and replaced by a simpler and more stringent requirement that all Ballast Tanks be subject to survey at each subsequent annual survey where either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and the protective coating is not renewed at special survey or intermediate survey. This will ensure that all Ballast Tanks with substantial corrosion or protective coating which is not in GOOD condition at the time of special survey or intermediate survey will be examined at each subsequent annual survey on tankers exceeding 15 years of age. (2242_ABzb dated 14/3/03)
This was later expanded to include all tanks used routinely for ballast water, both ballast-only and cargo/ballast tanks (2242_ABzc dated 14/3/03).

ABS further reviewed the issue of the survey of salt water ballast spaces and combined cargo/salt water ballast spaces with ABS' governing bodies in light of recent casualties and survey findings on other tankers. Their review found an increasing amount of coating breakdown/failure and subsequent rapid wastage in key structures after Special Survey No. 2, i.e. after 10 years of age. These conditions are most prevalent in the under deck structure and the side shell structure in way of the deep loadline. In a number of cases the serious wastage has caused fracturing of the under deck longitudinals and in some cases fracturing has extended to the main deck structure. This led ABS to refine proposed amendments to URs Z10.1, Z10.3 and Z10.4 to require (2242_ABzf dated 9/5/03):

a. For Tankers exceeding 10 years of age

> Salt Water Ballast Spaces and Combined Cargo/Salt Water Ballast Spaces. For tankers exceeding 10 years of age, salt water ballast spaces and combined cargo/salt water ballast spaces are to be internally examined at each subsequent Annual Survey where substantial corrosion is found within the tank or where the protective coating is found to be less than GOOD condition and protective coating is not repaired. Internal examination to be an Overall Survey.

b. For Tankers exceeding 15 years of age:

Salt Water Ballast Spaces and Combined Cargo/Ballast Spaces. For tankers exceeding 15 years of age, salt water ballast spaces and combined cargo/ballast spaces are to be examined internally at each subsequent Annual Survey. Where substantial corrosion is found within the tank, or where the protective coating is found to be in less than GOOD condition and the protective coating is not repaired then in addition to an Overall Survey, under deck structure and the side shell structure in way of the deep loadline is to be subject to Close-up Survey.

NK and BV replied that the proposed amendments made by ABS need to be substantiated in a transparent manner with technical data that ABS may possess and put forward for further assessment and discussion. (2242_NKn dated 14/5/03 and 2242_BVz dated 16/5/03)

DNV (2242_NVn dated 2/6/03), having carefully considered the practical consequences of taking the ship off-hire for gas freeing etc. and being concerned about the difficulties to have these surveys executed in a safe manner and whether the intended safety benefits in implementing the proposed extended scope of the annual survey of Ballast tanks will be met, **proposed the following alternative measures** which would be as effective and may not have such delaying effects to the ship:

1) Enhance the Intermediate Survey in UR Z10.1, 10.3, and 10.4 for Tankers after the 2 Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey. (This will correspond to the latest revised requirements of UR Z10.2 for Bulk Carriers.)
2) At Annual Survey of ballast tanks with substantial corrosion the overall survey should be replaced by close up survey with thickness measurements of the exposed area. (An overall survey of these tanks does not give sufficient information of the development of the areas with substantial corrosion.)
3) Further we will not fail to mention that the WP/SRC has proposed to extend the close up survey in cargo and combination tanks to 30% from the 3 Special / Renewal Surveys.
4) **Experience has shown that the coating condition rating category FAIR has a tendency to be stretched too far into the POOR condition. We will therefore propose that we task the WP/SRC to reconsider the acceptance criteria for the rating FAIR further.**
5) We do also question the need for redefining the definition of combination tanks, particularly since the category I tankers which are the ships that normally are fitted with these type of tanks are to be phased out 2 to 4 years from now. However DNV will not oppose to such a redefinition.

DNV requested Members to consider the above as an alternative to the ABS proposal, bearing in mind that we ought to present this to the industry prior to deciding.

ABS (3095_Aba dated 2/6/03), having further considered its earlier proposals in light of NVn, submitted a revised proposal for consideration by Council at C47 and replied to the above 5 DNV proposals as follows:

1) ABS fully supports this proposal.
2) While ABS agrees with this proposal, it is in fact already provided for in Z7 (3.2.3) and Z10.1 (3.2.5.1)--which require that "Suspect areas (which include any area where substantial corrosion is found) identified at previous Special Survey are to be examined. Areas of substantial corrosion identified at previous special or intermediate survey are to have thickness measurements taken." To us, this implies that close-up survey of these areas is to be done at annual survey in conjunction with the thickness measurements. However, we can

agree to tasking WP/SRC to explicitly require "close-up" survey in this connection and to amend Z7, and all the Z10's, appropriately to make this explicit, if there is majority support for this.

3) We agree that this has been put forward to GPG by WP/SRC via 0237hNVb, 27 May. However, these additional CAS close-up survey requirements do not apply to salt water ballast tanks; only to cargo oil tanks and combined cargo/ballast tanks.
4) **We agree with this assessment and we propose that the only way to eliminate the subjectivity and raise the standard is to eliminate the category "FAIR" completely; leaving only "GOOD" and "POOR" redefined as follows:**
   "GOOD -- condition with no breakdown or rusting or only minor spot rusting.
   POOR -- any condition which is not GOOD condition."
5) ABS does not agree with this proposal. We are particularly concerned that we need a very thorough and robust survey regime for these tankers precisely because they are subject to mandatory phase out over the next several years. We are very concerned that without additional IACS requirements, these tanks will receive little or no inspection and maintenance by owners or others after their last special or intermediate survey, if no substantial corrosion is found at that time. Rapid, localized wastage in way of deteriorating coatings may pose significant hazard if the survey regime is not further tightened as we are proposing.

In conjunction with the above comments on DNV proposals, ABS further considered their previous proposal in ABzf and modified it as follows:

- **ABS simplified the proposal to require annual examination of all salt water Ballast Tanks and combined Cargo/salt water Ballast Tanks irrespective of age, when either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and is not repaired.**
- the requirement for annual (close-up) examination of salt water ballast tanks and combined tanks is already required in Z10.1 (3.2.5.1). ABS proposed adding it to 2.2.3 for clarity and emphasis so that all the conditions which may lead to annual examination of such tanks are listed together in one place.
- Since the principal problem that we are trying to address is rapid, localized corrosion in way of breakdown or deterioration of the protective coating, we are proposing that the coating condition should be found and kept in "GOOD" condition to obviate the need for annual examination. **The attached proposal is made together with the proposals in items 3.1 (intermediate following Special survey 2 to have same scope as prior Special survey) and 3.4 (eliminating "FAIR" and redefining "POOR" as any condition other than "GOOD" condition.**

ABS requested to decide on a course of action at C47 for tightening the survey regime for tankers. They agreed that industry be informed of Council's decisions in this regard prior to IACS making the decision public, but IACS should maintain its independence and take decisive action in this matter. Debate with industry can only lead to delay and to a watering down and compromising of these important requirements.

NK agreed to task WP/SRC to reconsider the acceptance criteria of "FAIR" for clearly define the border between "FAIR" and "POOR" condition. However, **NK strongly opposed the elimination of "FAIR" coating condition from UR Zs** because this can not resolve to remove subjectivity of coating assessment. The three-categorization system of coating condition should be retained. (3095_NKa dated 5/5/03)

Outcome of C47

At **C47**, it was agreed that “Fair” would be retained as a rating and that GPG should instruct WP/SRC to redefine “Fair”, so that there would be a clear differentiation between “Fair”, “Poor” and “Good”. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have same scope as Special Survey No.2 (Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

Based on strong majority support Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

This matter should be discussed with Industry prior to adoption of any UR by Council.

In a final summary, the Chairman proposed that a constructive dialogue with Industry should take place on the IACS proposal as set out in WP1 plus maintaining 3.2.5.2 modified to say that ballast/combined ballast/cargo tanks will be subject to annual survey when considered necessary by surveyors.

After discussion in the JWG (Industry/IACS), GPG should propose final rules for this matter to Council, including acceptable repair definition.

F**UA 17:** *To instruct WP/SRC to develop guidance on coating repairs and more precise definition of “Fair” coating condition.*

Once approved, these requirements should be incorporated into Z10.3 and Z10.4.

FUA 15

1) *To prepare a draft revision to UR Z10.1 incorporating C 47 decisions:*
   - *The definition of “FAIR” remains as it is;*
   - *ABS proposed amendments to Z10.1 (annual examination of BWTs in certain conditions) were approved;*
   - *C47 agreed that the BWT coating requirements (Z10.1.2.2.3) for Intermediate Survey after Special Survey No.2 should be the same extent to the previous Special Survey.*
   - *Given the substance of the changes, the revised UR Z10.1 should be shown to Industry (OCIMG/Intertanko first among others) before adoption for their review and comments.*
   - *A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.*

2) *GPG Members are to confirm the draft revision to Z10.1 in consultation with their WP/SRC members by correspondence. See 3095_IGa of 13/06/03.*

According to C47 FUA 15, GPG Chairman circulated (3095_IGa dated 13/6/03) draft amendments to UR Z10.1 as agreed in principle at C47.

Having received a number on comments, GPG Chairman (3095_IGb dated 27/6/03) informed that the Council Chairman confirmed that GPG is not to amend the principles agreed at C47, i.e. we are not empowered to change "GOOD" to "FAIR" as proposed by DNV and NK, nor to amend the definitions of "FAIR" and "POOR" as proposed by DNV.

DNV's intention to possibly lodge a reservation was noted, however the matter should be raised at Council and not be dealt with by GPG. An amended draft text incorporating the non-substantive changes proposed by Members was circulated.

DNV said that its understanding was that the draft should be circulated to the Industry (ICS, INTERTANKO, and BIMCO) prior to adoption by Council. (3095_NVc dated 30/6/03)

GPG Chairman (3095_IGc dated 30/6/03) circulated a draft amendment of UR Z10.1 for Council's agreement and use in discussions with the industry associations.
The draft was generally agreed by GPG but individual Members have requested that the following matters (which were deemed to be outside the remit of GPG in this task) be brought to Council's attention for further consideration:

1 DNV and NK stated that they can not accept a requirement for annual surveys of ballast tanks when the coating condition is less than GOOD and propose that GOOD be changed to FAIR.
2 In connection with item 1 above, DNV also propose to amend the definitions of FAIR and POOR in order to raise the standard of FAIR.

Council Chairman (3095_ICb dated 14/8/03) concluded that Council has agreed that the draft amendments to UR Z10.1 attached to IGc reflect Councils' decision taken at C47 and that they be circulated to industry associations.
Perm Sec was therefore invited to submit the draft to OCIMF and INTERTANKO in view of discussion at the IACS/ industry meeting on 29 August.

2. Discussion with Industry (29/08/2003 – 11/10/2003)

As requested by Council, the whole matter was presented to Industry during the "general matters" meeting with IACS held on 29 August 2003; comments from Industry were requested. In the following an extract from the minutes of the meeting (see message 3100aIAb dated 5 September 2003):

__________________________ from Meeting minutes ________________________________

4. & 5. Annual surveys of ballast tanks and IACS guidelines on coating repairs

M. Dogliani introduced the matter (see Items 4&5 in Appendix).

A. LinoCosta gave a presentation to show where concerns and decisions stand: too many cases when coating was considered fair at SS but problems occurred just after one/two years.

N. Mikelis commented on draft amendments to Z10.1 (Rev.11) stating that the extent of annual survey is not clear; it should be limited to the affected zones, e.g. coating breakdowns, only.
M. Guyader clarified that, in this draft amendments, it is expected an overall survey of the whole tank and a close up survey of the affected zones.
N. Mikelis noted that, in the draft amendments to Z10.1 (Rev.11), the intermediate survey at 12.5 years would have the same scope as the previous special survey and that needed a justification. See 7 a).
M. Dogliani said that Z10.1 (Rev.11) was adopted in August 2003 and will be introduced into IACS Societies' Rules over the next year.

Conclusions:
4.1 Industry shared IACS concerns on coatings and, in general, agreed with the draft amendments to Z10.1 (Rev.11) suggesting also extending them to Z10.2 on bulk carriers

4.2 Industry agreed that a guideline for surveyor on coating would greatly improve uniform application of so-amended Z10.1 including issues such as how to consider load bearing elements when judging GOOD/FAIR/POOR status and how to consider bottom pitting in connection with GOOD conditions
4.3 Industry will more precisely comment, by the end of September, the draft Z10.1 so as for IACS to finalise the matter, as planned, for the Council's December meeting.

Item	Title	Industry recommandation	IACS/ M. Dogliani Introduction
4 & 5	Annual survey of ballast tanks IACS guidelines on coating repairs	NN	**1. IACS is considering the following:** - **amend UR Z10.1 (draft circulated to Industry) to the effect that in case at Special Survey or Intermediate Survey the coating in a ballast tank is found less than GOOD, either GOOD conditions are restored or the tank's coating is inspected at each annual survey;** - **develop IACS guideline to assist an uniform application of the so modified (if adopted) UR Z10.1; the guideline should address which repairs are necessary to restore GOOD conditions from FAIR and POOR respectively and which are the criteria for the restored (after repair) situation to be rated as GOOD.**

______________________________ End of extract from minutes ____________________________

INTERTANKO commented (see R. Leslie email to GPG dated 25 September 2003):

- expressing their concern for the draft Z10.1 and underlining

  a) targeting: concerns that, if not properly dealt with, Z10.1 would target all ships and not just those which need intervention; the view was expressed that guidelines would probably solve the matter;

  b) definition: indicating that the current definitions of GOOD, FAIR and POOR is not clear enough and that the matter would be even worst with GOOD and NON GOOD; again it was indicated that guidelines could solve the matter;

  c) expertise: expressing doubts on IACS' surveyors expertise and ability to judge coating conditions; in this respect they (hiddenly) suggest that IACS position is unclear when we say that we are not competent to judge the coating during construction but then we are competent to judge coating during operational life. Even if not explicitly stated, the impression is that also in this case guidelines would help.

Additionaly, INTERTANKO suggested a (quite detailed) set of assessment criteria.

The matter was then finally addressed at the TRIPARTITE Meeting (held in Soul on 29/30 September 2003). There Industry agreed that the way forward was the (joint) development of IACS guidelines (see minutes attached to message 3100_RIe dated 11 October 2003, an extract of which is reproduced below).

______________________________ Extract from the TRIPARTITE minutes ________________

Industry is concerned by the definition of GOOD/NOT GOOD in relation to coating repairs and acceptance criteria. Industry agreed that new guideline on this, which IACS is already producing, was the way forward.

_______________________________ End of the extract from the minutes __________________

3. Further developments

a) from the above, it was concluded that, provided the guidelines are sound, Industry would accept the concept of Z10.1 (draft) Rev. 12, therefore an IACS team and a JWG were established in order to progress the matter of the guidelines (among other related matters).

b) the team of IACS experts on coating developed draft guidelines and provided recommendations to GPG on the way forward (attached to message 3095bNVc dated 20 November 2003).

c) the guidelines were discussed within the JWG with Industry (see draft minutes circulated within GPG with messages 3095cIGd and 3095cIGe both dated 13 March 2004)

d) further suggestions and comments (as requested at the meeting) were provided by Industry (not circulated to GPG)

e) Bulk Carrier Industry is recommending that similar guidelines are developed in due time also for bulk carriers

f) at DE47 and MSC78, IMO is asking Industry and IACS to develop (compulsory) performance standards for coating of newbuilding (double hull spaces of DSS Bulk Carriers), a matter which is, indirectly related to the above one.

1 June 2004
M. Dogliani
IACS GPG Chairman
IACS JWG/COR Chairman

Subject: FW: 1060gNVs; WP/SRC - Task 102 - Harmonization of UR Z 7 and Z 7.1

25 May 2005

To: Mr. B. Anne, Chairman of IACS Council,
cc: Council Members, IACS Perm. Sec.

Ref.: My mail NVr dated 20 May 2005

DNV have further studied the amendments to UR Z10.1, Z10.3, and Z10.4, and as a result are presenting the following as a compromise solution:

General comment:
From the comments by other Members it is obvious that there is reluctance to accept annual surveys of ballast tanks with a common plane boundary to heated cargo tanks in the case where the coating is in good condition. This is particularly unreasonable as at the same time we enhance the Intermediate survey of Tankers between 10 and 15 years to also include examination of all ballast tanks, meaning that all ballast tanks will be close up surveyed with 2-3 years intervals from the ship is 10 years old, with the possibility for the surveyor to require thickness measurements and testing of the tanks to ensure the structural integrity of the tanks if necessary.
It is also proposed for the Intermediate survey between 5 and 10 years, to increas the scope from representative to all ballast tanks, a requirement DNV find to strict, and require that we here keep the original text.
If a ballast tank is found to have coating in GOOD condition at the renewal or intermediate survey, a deterioration of the tank beyond structural reliability is very unlikely even if the tank has a common plane boundary to a heated cargo tank.

DNV finds it particularly unreasonable to have this requirement to apply
to double hull tankers for the following reasons:
- these ships have double hull and the risk of pollution is here much reduced,
- the double hull is constructed with small spaces giving improved structural reliability,
- almost all double hull tankers below VLLC have heated cargo tanks, and all ballast tanks have common plane boundaries to these tanks, meaning that this requirement will apply to a major part of the tanker fleet in the future,
- the ballast tanks of double hull tankers are so designed that a general examination of these tanks will be identical to a close up survey,
- survey of ballast tanks of double hull tankers will mean either gas freeing of all cargo tanks or at least dropping the inert gas pressure of all cargo tanks in addition to proper airing of all ballast tanks.

Since the single hull tankers will be faced out in the near future, and for clear political reasons, DNV will as a compromise proposal to keep paragraph 2.2.3.1 and 4.2.2.2 in Z 10.1 as amended by Council (ref. IAo) but amend it to not include 2.2.3.1.e, 4.2.2.2.e and last paragraph of 3.2.5.1 in Z10.3 and Z10.4. In addition we request that the original text of 4.2.2.1 is kept.
If BV, ABS and other Members can accept this DNV is willing to drop our reservation presented at C49.
DNV's proposal will then be as follows:

Z10.1:

2.2.3.1: This paragraph can be accepted as is for the reasons stated above.
3.2.5.1: This paragraph is accepted as amended.
4.2.2.2: This paragraph can be accepted as is for reasons stated above.

For other comments to Z10.1 see NVo and NVp.

Z10.3:

2.2.3.1.e to be deleted.
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept."For tanks used for water ballast ---"
4.2.2.2.e to be deleted

Z10.4

2.2.3.1e to be deleted
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept, "For tanks used for water ballast --"
4.2.2.2.e to be deleted.

For details see attached document where the text for the requirements in Z10.3 and Z10.4 that DNV will accept is stated.

Best Regards

Arve Myklebust
on behalf of
Terje Staalstrom
DNV IACS Council Member

Annex 2 to TB (Harmonization Z10s)

WP/SRC Task 114 "Clarify the procedure of verification and signature of the thickness measurement report"

Item No.	Item	ABS	BV[1]	CCS	CRS	DNV	GL	IRS	KR	LR	NK	RINA	RS
1	**Verification onboard**	**.**											
1.1	Minimum extent of measuring points for direct verification by attending surveyor specified	No	No	No	No	No	No	No	Yes	No	No	Yes	No
1.2	Preliminary TM record to be signed upon completion of the measurements onboard	Yes	Yes [7]	Yes	No (copy taken)	No[3]	No[6]	Yes	Yes	Yes	Yes	No[8]	No
2	**Final TM report**												
2.1	Signature of all pages in TM record required	No	No	No	Yes	No	Yes	Yes	No	No	No[5]	Yes	Yes
2.2	Signature of 'cover' ('general particulars') page only	Yes	Yes	Yes	No	Yes	No	No	No[4]	Yes	Yes	Yes	No
2.3	Measuring points verified by attending surveyor required identified in TM record and signature of the corresponding pages required	No	No	Yes Without signature	Yes	No	No	No	Yes	No	No	No	No

2004-04-20

[1] Instructions not clear regarding signature of the thickness measurement record

[2] Signature on front and last page, stamp on all other pages, or signature on each page (IACS TM forms)

[3] Upon completion of measurements onboard a draft report in electronic format (DNV TM template, including operator's notes as relevant) to be given to attending surveyor

[4] Signature of cover page, pages of meeting record and pages of attended measuring points

[5] Each page to be signed in case of 'loose-leaf' type record

[6] Preliminary TM record has to be passed to the Surveyor, signed by the Operator

[7] The only measures which the Surveyors can certify exact are those for which that they have seen the results on the screen of the apparatus. That means in fact few points in comparison with the numbers of recorded measures.

[8] The Surveyor reviews the TM record for completeness and assessment of TM readings, but no signature required.

Annex 3: **Technical Background**
(May 2005)

UR Z7s and Z10s (Corrosion Prevention System)

1. Objective:

To clarify whether the survey of anodes is a class matter, and if so, whether acceptance criteria for anode should be developed.

2. Method: GPG by correspondence (5037_)

3. Discussion

3.1 BV initiated GPG discussion as follows:

Paris La Défense, 8 Mars 05

1 - We have noticed that, in the draft UR Z's (7.1, 10.1 to 10.5) issued further to the WP/SRC Task 102, the original sentence "......the examination may be limited to a verification that the hard protective coating remains efficient......" has been replaced by ....that the corrosion prevention system remains efficient....". in a number of paragraphs (such as , for instance, Z 7.1, 4.2.3.1 a) ; Z 10.2 4.2.3.3 ;), in line with IMO Res.A744(18).

2 - However, a corrosion prevention system is defined, in the same UR Z's and in IMO Res.A744(18) , as being either a full hard protective coating or a full hard protective coating supplemented by anodes.

3 - The above would mean that the survey of the anodes is a classification matter.

4 - However, whereas coating conditions are defined as good or fair or poor, there are no criteria in the IACS URs and IMO Res. A744(18) for the anodes condition.

5 - Assessing the anodes condition to confirm that they "remain efficient" looks to BV to be a quite difficult task for the ships in service Surveyor.

6 - Member's view and interpretations on the following would consequently be appreciated:

- do Members consider that the above requirements in IACS URs imply that survey of anodes is part of the classification ?
- do Members consider that the above requirements in IMO Res. A 744 (18) imply that survey of anodes is mandatory?
- if yes, what is the acceptance criteria to conclude that the anodes" remain efficient" ?

3.2 The majority of GPG Members replied that they did not include requirements for anodes in their class rules.

LR / ABS / DNV / KR / NK / RINA / RS were of the view that the condition of any anodes fitted should be recorded for information purposes as the survey of anodes is neither a classification matter nor a mandatory requirement in IMO A.744(18) and has no impact on future surveys (5037_LRa**). [**Note; LR further clarified that “Whilst I agree that the performance of anodes is not normally a class matter LR does require that as part of Special Survey on oil tankers : "The attachment to the structure and condition of anodes in tanks are to be examined ." Therefore we cannot say that 'the survey of anodes is not a classification matter'**. 5037_LRb]**

However, GL said that “for GL, anodes are a matter of class and as such are subject to plan approval as well as surveys. In case of missing or worn-out anodes we issue a condition of class”(5037_GLa&b).

CCS advised that its rules have a general requirement relating to anode survey, which is only conducted, through sampling, during construction, docking survey or where there is a definite requirement for the survey of ballast tanks.

NK proposed that the following footnote be added to Z7s and Z10s:
“The survey of anodes is not a classification matter.” No majority support was achieved.

4. Conclusion

RINA suggested to simply amend the definition of "Corrosion Prevention System" in paragraph 1.2.9 of UR Z7 (and, of course, the paragraphs in all the other UR Zs containing the definition of "Corrosion Prevention System") in order to eliminate any reference to anodes. This proposal would leave room for Societies willing to include additional class requirements for anodes to do so in their Rules.

GPG agreed.

**RINA proposed amendments to paragraph 1.2.9 of UR Z7
and corresponding paragraphs in all other UR Zs
(5037_RIb, 6 April 2005)**

1.2.9 Corrosion Prevention System

A corrosion prevention system is normally considered ~~either:~~ a full hard protective coating.
~~.1 a full hard protective coating, or~~
~~.2 a full hard protective coating supplemented by anodes.~~
Hard protective coating is usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer’s specifications.
Where soft coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

Annex: Council Chair’s conclusive message.

6 May 2005
Permsec

Annex. (5037_ICb, 15 May 2005)

To : All IACS Council Members
c.c : Mr. R. Leslie, IACS Permanent Secretariat

Ref. Mr G-Y. Han's message IAa dated 6 May 05
Message ICa dated 6 May 05
Admiral R.E. Kramek's message ABb dated 13 May 05

Paris La Défense, 15 May 05

1 - All Members have agreed with the texts attached to Mr Han's message.

2 - Further to ABS comments the reference to anodes is to be deleted in Annex I and in tables IX (IV) and IX(II).

3 - further to ABS questions regarding what IACS plan to do regarding IMO and A.744(18) further to IACS deletion of reference to anodes from the UR Z7's and UR Z10's it is to noted that:

The Item 1.2.9 in UR Z1O.1 and relative items in these URs states
1.2.9 10 Corrosion Prevention System: A corrosion prevention system is normally considered either:
.1 a full hard protective coating, or
.2 a full hard protective coating supplemented by anodes.
Hard Pprotective Ccoating is to usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specification.
Where Soft Coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

- therefore the anodes are not considered as the main means of protection against the corrosion It is only a supplement;

- there is no provision in UR Z7's and Z10's to evaluate the level efficiency of the anodes;

- there is no specific requirements in case of lack of efficiency of the anodes.

The experience has shown that ballast tanks only protected by anodes are subject to corrosion when the anodes are becoming less efficient.

The anodes are active only when immersed by sea water. Therefore the upper part of the ballast tanks are not protected when the ballast is full of water and the ballast is not protected when it is empty..

The ships operators are reluctant to replace the anodes especially in upper part which request fitting of scaffolding fo welding the anode supports to the structure.

The above arguments justify the reasons why IACS consider that the anodes are not class item.

4 - These arguments can be used by IACS Members attending the WG bulk carriers at MSC 80 to try to obtain deletion of the reference to anodes in A. 744(18).

Best regards,

Bernard Anne
IACS Council Chairman.

TB

UR Z10.2(Rev.18, Corr.1 Jan 2006)

1. Para. 1.4 and 7.1.3

2. Para. 5.5.4 and 5.5.6

Survey Panel Task 22 – Amend applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

Technical Background

Z7(Rev.12)
Z7.1(Rev.3)
Z10.1(Rev.13, para.1.4 & 7.1.3)
Z10.2(Rev.18, para. 1.4 & 7.1.3)
Z10.3(Rev.8, para. 1.4 & 7.1.3)
Z10.4(Rev.3, para. 1.4 & 7.1.3)
Z10.5(Rev.2, para. 1.4 & 7.1.3)

1. **Objective**

To amend the applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

2. **Background**

IACS QC findings, through audits of numerous Societies, which indicated concerns over Surveyor attendance and control of thickness measurement processes.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

To align Close-up survey requirements and thickness measurements in the applicable URZ7s and URZ10s, in accordance with PR19, all Panel members agreed through correspondence and a final vote at the fall Survey Panel meeting, that URZ7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 should include in the applicable sections of the noted URs as proposed by the Survey Panel the wording " In any kind of survey, i.e. special, intermediate, annual, or other surveys having the scope of the foregoing ones, thickness measurements of structures in areas where close-up surveys are required, shall be carried out simultaneously with close-ups surveys."

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Technical Background

UI SC 191 (Rev.2, Oct 2005)

&

UR Z10.1 (Rev.13)
UR Z10.2 (Rev.18)
UR Z10.3 (Rev.8)
UR Z10.4 (Rev.3)
UR Z10.5 (Rev.2)

1. Objective

- to confirm whether the guidelines for approval/acceptance of alternative means of access (now REC91, ex Annex to UI SC191) is mandatory or non-mandatory.
- to consider other safety related proposals.

2. Background

The DNV proposal to submit the UI SC191(Rev.1, May 2005, Annex 1) to IMO DE49 triggered a number of discussion points that led to amendments to the following resolutions:

UI SC191(Rev.2)
New REC 91
REC 39(Rev.2)
UR Z10s

Points of Discussion

3. Is the Annex to UI SC191(Rev.1, May ’05, guidelines for approval / acceptance of alternative means of access) mandatory or non-mandatory ?

   Answer: Non-mandatory. Hence, re-categorized as new REC 91.

4. Limitation of use of rafts in bulk carrier holds

   DNV proposed that conditions for rafting should be limited to areas, such as anchorage or harbour, where swell conditions are limited to 0.5m. After discussion, GPG approved the ABS’ alternative proposal to use the swell condition as a basis to determine the appropriateness of rafting, instead of geographic areas(harbours or anchorage). 5.5.4 of Z10.2 refers.

RINa proposed that para 5.5.4 should be included in all the Z10s. NK's objection is recorded as follows (3037hNKq, 29/08/2005):

> 1. With regard to RIm of 26 August 2005, NK considers that the proposed amendment to 5.5.4 should be limited to UR Z10.2.
>
> 2. Rafting survey for tankers are actually carried out on the open sea from a discharge port to a loading port and in such situation the rise of water within the tanks would always exceed 0.25m. It is different situation from rafting survey for hold frames of bulk carriers normally conducted in a harbour or at an anchorage.
>
> 3. If the same requirement applies to tankers, any rafting survey for cargo oil tanks and ballast tanks of tankers would be prohibited. This is not practicable under present survey procedure for tankers.
>
> 4. Therefore, NK can not support Laura's proposal that the proposed amendment to 5.5.4 of UR Z10.2 is introduced into the other URs and new Recommendation.

For compatibility with the IMO's mandatory requirements*, GPG decided to add the same amendment to all the UR Z10s.

*

- Appendix 4 to MEPC.99(48) ' Mandatory requirements for the Safe Conduct of CAS Surveys'
- MSC.197(80) – amendments to A.744918), Annex A for DSS and SSS bulk carriers and Annex B for single and double hull oil tankers.

As a consequence, 5.5.1 of REC 91(ex Annex to UI SC191) was also amended:

-to remove the reference to dynamic /sloshing (as the 0.25m rise was considered negligible);

-to refer to the rafting conditions contained for cargo holds in Z10.2 and Z10.5 and for oil cargo tanks in Z10.1 and Z10.4.

5. Means of access from longitudinal permanent means of access within each bay to rafts

GPG reviewed the proposal that the following text be added to Z10s:

A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay.

(Technical Background: for the safety of surveyors)

There may be ships which are arranged in accordance with para b, page 8 of the Annex to the current SC 191 (i.e., no means of access from the LPMA in each bay to a raft is required) and therefore could not be rafted if the sentence proposed by RINA("A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay") is included in the Z10's.
GPG therefore agreed not to include this sentence in Z10s.

For the same reason, the same sentence was not added to Rec.39.

Finally, GPG added the following sentence to UI SC191(interpretation for II-1/3-6):

> *A permanent means of access from the longitudinal platform to the water level indicated above is to be fitted in each bay (e.g permanent rungs on one of the deck webs inboard of the longitudinal permanent platform).*

6. Implementation

It was agreed that the revised UI SC191 be implemented to ships contracted for construction 6 months after adoption by Council.

UI SC191 was also edited in line with IMO MSC/Circular. 1176, leaving its mandatory language (is/are to, shall) unchanged.

(Note: UI SC191(Rev.2) makes references to the following new Recommendations:
- REC 90: Ship Structure Access Manual
- REC 91: Guidelines for approval/acceptance of Alternative Means of Access)

23 September 2005
Permanent Secretariat
Updated on 13 Oct 2005.

Survey Panel Task 11 – Unified Periodic Survey Requirements related to SOLAS Reg. XII/12 & Reg. XII/13.

Technical Background
Amendments to UR Z10.2(Rev.19, Jan 2006) and UR Z10.5 (Rev.3, Jan 2006)

1. **Objective**

To amend UR 10.2 Section 2.6 and 3.4 and UR Z10.5 Section 2.6 and 3.3 to include survey requirements related to SOLAS reg. XII/12 and XII/13.

2. **Background**

This task was originally discussed during the WP/SRC annual meeting which took place at DNV Headquarters on the 26th to 28th October 2004; it was subsequently recorded under paragraph 9 "any other business" of the minutes of this meeting.
While the SOLAS Reg.XII/12 (hold, ballast and dry spaces water level detectors) and XII/13 (availability of pumping systems) retroactive requirements for existing bulk carriers have entered into force on 1st July 2004, as required by IMO Res.MSC.134(76), the IACS UR S 24 has been deleted on 1st January 2004.In addition, SOLAS does not include any periodical survey requirements for such detection systems and pumping systems.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel member from BV raised this issue at the February 2005 Survey Panel meeting and volunteered to propose amendments to the applicable URs for Panel members to review and comment on through correspondence. At the Fall meeting of the Survey Panel, it was agreed upon by all Panel members that the proposed amendments for UR Z10.2 and Z10.5 as applicable, which were proposed by BV were acceptable.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Submitted by Survey Panel Chairman
4 Nov 2005
approved on 31 Jan 2006 (5031fICa)

Survey Panel Task 4 –
Means of Access for Close-Up Surveys of Capesize Bulk Carrier hold frames
Technical Background
UR Z10.2 / Section 5.3 (Rev. 20, s/n 4110a, 10 Feb 2006)

1. Objective

To amend the requirements of UR 10.2 section 5.3.2 regarding the Close-up survey of hold frames with respect to acceptable means of access.

2. Background

In a report to Council at C50 on the loss of side shell on a capesize vessel, it was stated that issues regarding the means of access for survey of hold frames was raised by the incident which had Council request the Survey Panel to review the current requirements for means of access for the surveyor, especially on existing capesize vessels.

3. Methodology of Work

The Survey Panel, at its February 2005 meeting decided that this task should be dealt with by a project team, led by NK with members from BV, ABS, KR and CCS participating.

4. Discussion

The members of the project team, through correspondence and one meeting in Japan, came to an agreement on the revisions to URZ10.2 Section 5.3..2 on how to address the concerns of Council. It was decided that the requirements for means of access be divided into two sections to better define the requirements applicable to each size of vessel; capesize and all bulk carriers under capesize. In addition, the requirements for capesize bulk carriers were then divided to indicate different requirements for annual, intermediate and special survey. Regarding the amendments for acceptable means of access, it was agreed upon by the Project team that hydraulic arm vehicles, boats or rafts, and portable ladders for bulk carriers less than capesize, should be added to the list of equipment for means of access. The Project Team representative at the Fall Survey Panel meeting from BV, presented the project team proposals to the Panel, which after some editorial changes, unanimously agreed to the proposed amendments to URZ10.2 section 5.3.2.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose 1 January 2007 as an implementation date.

Submitted by Survey Panel Chairman
2 Nov 2005

Permsec's Note

1. LR sought confirmation from the Survey Panel as to whether these amendments did not go against SOLAS regulation II-1/3-6 and TP and IACS UIs and MSC Circular. LR added that Bulk carriers being built today would have Access Manuals which would define means of access for close-up surveys approved by ROs on behalf of Administrations.

2. It was then confirmed that the Survey Panel's proposal was consistent with all IMO and IACS requirements and recommendations except that for capesize and above, it limited the use of portable ladders. In that regard, ABS proposed an editorial modification to achieve consistent text with REC.91 and that REC.91 be revised to refer to the limitation of ladders introduced in 5.3.2 and 5.3.3 of UR Z10.2 (Rev.18). See REC 91, para. 5.6.1 (Rev.1, Nov 2005).

3. For reference, ABS' clarifications to the points raised by LR are attached (4110aABb, 16 Nov 2005).

4. Council discussion

4.1 Editorial nature:

Council approved the NK proposal to re-number the paragraphs 5.3.2~5.3.4, and to relocate references to "shell frames" / "hold frames" from the bulleted items to the chapeaux of the re-numbered paragraphs by referring to these cargo hold structural members as "cargo hold shell frames". This is consistent with the current text of Z10.2 which predominantly refers to these cargo hold structural members as "shell frames".

4.2 Substantive nature - para.5.3.4

4.2.1 NK's first proposal:

The following NK's proposed revision of paragraph 5.3.4 of Z10.2 did not achieve 3/4 majority support by Council Members.

> "5.3.4 For close-up surveys of the cargo hold shell frames of capesize bulk carriers (100,000 dwt and above), the use of *free standing* portable ladders *irrespective of their length*, is not accepted, and one or more of the following means for access, acceptable to the surveyor, is to be provided:"
>
> **Not adopted, Reason**: The introduction of "free standing" portable ladders is contrary to what GPG and the Survey Panel unanimously agreed with respect to prohibiting the use of any type of portable ladders (free standing, articulated, or otherwise) for close up surveys of cargo hold shell frames of bulk carriers (100k dwt and above). The text of the re-numbered paragraph 5.3.4 therefore remained without changes.

4.2.2 NK's 2nd proposal:

NKc offered a "compromise" proposal with a view to resolving this dilemma which would retain the original text of 5.3.4 but add a paragraph allowing the use of portable ladders fitted with a mechanical device to secure the upper end of the ladder only for Annual Survey of cargo hold shell frames of capesize bulk carriers

> Under 5.3.4
> Notwithstanding the above requirements, for close-up surveys of the cargo hold shell frames at Annual Survey, the use of portable ladder fitted with a mechanical device to secure the upper end of the ladder is accepted.

4.2.3 LR agreed but expressed the following view:

If the argument for limiting the use of ladders is still valid then there is a need to specify that their use is permitted only for "Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in the forward cargo hold", however "Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a Close-up Survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a Close-up survey of sufficient extent of all remaining cargo holds" the ladders should not be used and the hold should be staged.

LR's text was then modified by the Chairman to address the minimum extent of close-up survey of frames of capesize bulkers age 10 and older, at annual survey as required in 3.2.4 of UR Z10.2:

> Under 5.3.4:
> Notwithstanding the above requirements, the use of a portable ladder fitted with a mechanical device to secure the upper end of the ladder is acceptable for the "*close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating of the forward cargo hold*" at Annual Survey, required in 3.2.4.1.b, and the "*one other selected cargo hold*" required in 3.2.4.2.b.
>
> **Adopted on 10 Feb 2006.**

Attached: ABS' clarifications to the points raised by LR are attached (4110aABb, 16 Nov 2005).

Subject: 4110aABb: Close-up surveys of bulk carrier hold frames, P/SU Task [4] (C50 FUA 7)

Date: 16 Nov 05

TO: Mr. Steven McIntyre, IACS GPG Chairman

CC: IACS GPG Members
CC: IACS Permanent Secretary: Mr. R. Leslie

FROM: S. R. McIntyre
File Ref: T-12-2

Subject: 4110aABb: Close-up surveys of bulk carrier hold frames, P/SU Task [4] (C50 FUA 7)

I note Kosta's LRb request to "*know the effect the proposed amendment will have on the designs already formally accepted to comply with SOLAS and IACS UI*" before giving final approval to the amendments. While the effect will only be known for each ship depending on the arrangement provided, I have the following comments to the numbered points Kosta raises:

3. I do not consider that a "*significant impact*" will result if IACS limits the use of portable ladders > 5m in length, since use of these ladders would otherwise greatly increase the time to survey, gauge and, if necessary, repair the side shell relative to employing other alternatives (e.g., cherry pickers). While the owner would have paid for these ladders based on RO's approval, the proposed UR would limit their use for survey only and these ladders are still available for use by the crew (which is included in the objectives of the TP's) to carry out maintenance and inspection.

4. Until such time that the TP's, MSC/Circ.1176 and/or the UI SC 191 are revised, ABS will ensure that those responsible for approving the SSAS are aware of the more limited choice of alternative means of access for capesize bulk carriers as per draft provisions of UR Z10.2.

4.1 The draft proposals for Z10.2 do not address, and therefore allow, the use of portable ladders > 5 m in spaces other than cargo holds.

Regards,
S. R. McIntyre
ABS IACS GPG Member

Survey Panel Task 37 – Amend UR Z10.2 to increase the scope of the survey requirements of Special Survey No.2 and the Intermediate Survey between Special Survey No. 2 and No.3 for Cape Size Bulk Carriers
Technical Background Document
UR Z10.2
(Rev.21, May 2006)

1. Objective:

Amend UR Z10.2 to increase the scope of the survey requirements of Special Survey No.2 and the Intermediate Survey between Special Survey No. 2 and No.3 for Cape Size Bulk Carriers

2. Background

The project team from Survey Panel Task 4, which dealt with amending the close-up surveys of bulk carrier hold frames, recommended to the Survey Panel at the Fall 2005 meeting that the Survey Panel should be tasked to amend the relevant sections of UR Z10.2 to increase the scope of requirements for Cape size bulk carriers because of the intermediate survey between SS No2 and & 3 is more critical than Special survey no.2 in respect of the close-up survey of hold frames.

3. Discussion

The member from NK proposed the following:
NK does not agree with the draft amendments of special survey No.2 in IAb which are completely same as the requirements of special survey No.3.
There should be some difference between the requirements of special survey No.2and No.3 because the requirements in the Table I are become stricter as ships become older.
NK proposed to reduce "one other selected cargo hold" from the draft.
All members agreed to the proposal from NK, with further minor amendments from RINA and BV, which was agreed upon unanimously by Panel members at the Spring 2006 meeting.

4. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules/procedures. Assuming that GPG and Council approve the amendments, the Survey Panel would propose **July 2007** as an implementation date.

Submitted by Survey Panel Chairman

Survey Panel Task 43 – Amend the applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

Technical Background

(UR Z10.2, Rev.22, June 2006)
(UR Z10.4, Rev.4, June 2006)
(UR Z10.5, Rev.4, June 2006)

1. **Objective**

Amend applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

2. **Background**

Due to the different application of substantial corrosion in the CSR from the current Unified Requirements.

3. **Methodology of Work**

Panel members discussed the proposed revisions through correspondence up to the Spring Panel meeting where final amendments were agreed upon for submittal to the IACS Hull Panel for review.

4. **Discussion**

After much discussion between all Panel members at the March 2006 Survey Panel members, a unanimous decision was reached as to the wording of CSR Substantial corrosion in UR Z10.2, 10.4, and 10.5 in section 1.2.9 and was then submitted to the Hull Panel for review and approval. The hull panel concluded that the Survey Panel definition for CSR substantial corrosion was not entirely accurate and recommended further amendments to clarify the actual requirements. The new definition was then circulated to the Survey Panel for a final review and was unanimously agreed upon.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules/procedures. Assuming that GPG and Council approve the amendments, the Survey Panel would propose **July 2007 as** an implementation date.

Submitted by Survey Panel Chairman

Technical Background

UR Z10.1 (Rev.14), UR Z10.2 (Rev.23), UR Z10.4 (Rev.5) & UR Z10.5 (Rev.5)

Survey Panel Task 3 – Maintenance of Alignment/ Compatibility of IACS URs and IMO survey requirements

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements regarding resolution MSC 197(80) – amendments to A744(18)

2. **Background**

IMO survey requirements to ESP vessels as amended in A744(18) as noted in MSC 197(80), with an implementation date of 1 January 2007.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel members, at the fall 2006 Survey Panel meeting, finalized the amendments to the applicable URs due to changes adopted at MSC(80).
Additionally, Members noted that URZ10.4 paragraphs 2.2.3.1 and 4.2.2.2 does not require examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80). The survey panel agreed that if this is the position that IACS would like to take regarding double hull tankers, then it should be brought to the attention of IMO at the next IMO meeting, DE50 in March 2007.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve the amendments, the Survey Panel would propose January 2008 as an implementation date, although the IMO implementation date is January 2007.

Submitted by Survey Panel Chairman
9 January 2007

GPG discussion

All members agreed to omit the requirement of examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80), from URZ10.4 for double hull tankers and

that it should be brought to the attention of IMO at DE50. In addition ABS proposed that paragraphs relating to similar requirements in URZ10.1 should also be deleted for consistency and this was agreed by members.

Members also made a number of minor/editorial corrections to the text prior to their approval of the revised documents.

Added by Permanent Secretariat
23 April 2007

Technical Background Document

UR Z10.5 (Rev.6 April 2007) & UR Z10.2 (Rev.24 April 2007)

(Survey Panel Task 10 – Develop survey requirements for void spaces of ore carriers)

1. Objective:
Develop survey requirements for void spaces of ore carriers

2. Background
DNV requested at WP/SRC Annual meeting October 2004 to develop survey requirements void spaces of ore carriers. See the attached document « Ore Carriers, Hull Survey Requirements » for easy reference.
NK submitted a « A case study on a certain Ore Carrier » dated 22 October 2004 for this purpose.

3. Discussion
The task has been carried out by a Project Team chaired by DNV Survey Panel member and with Survey Panel members from BV, LR, NK and RINA.

The Project Team drafted new amendments to Unified Requirement UR Z 10.5 « Hull Surveys of Double Skin Bulk Carriers » using the same principles contained in the survey requirements of UR Z10.1 for ballast spaces of single hull oil tankers with appropriate adjustments recognizing that void spaces do not carry ballast water.

In that respect, a new TABLE I/Sheet 2 was developed to cover the minimum requirements for close-up surveys at special hull surveys of ore carriers. The existing TABLE I, renamed TABLE I/Sheet 1, was made applicable to double skin bulk carriers excluding ore carriers.

Accordingly, TABLE III/Sheet 3 (REQUIREMENTS FOR EXTENT OF THICKNESS MEASUREMENTS AT THOSE AREAS OF SUBSTANTIAL CORROSION OF DOUBLE SKIN BULK CARRIERS WITHIN THE CARGO LENGTH AREA) was renamed STRUCTURE IN DOUBLE SIDE SPACES OF DOUBLE SKIN BULK CARRIERS INCLUDING WING VOID SPACES OF ORE CARRIERS.

In addition, Sheets 15 and 16 of URZ10.2 Annex II are to be removed.

The draft amendments to UR Z10.5 were presented to the Survey Panel members on the 13th-15th September 2006 meeting at ABS Headquarters in Houston and were finally agreed by all members on the 22nd September 2006.

4. Implementation
The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class Rules/procedures. Assuming that GPG and Council approve the amendments by the end of 2006, the Survey Panel would propose as an implementation date for surveys commenced on or after the **1 July 2008**

Submitted by Survey Panel Chairman
22nd March 2007

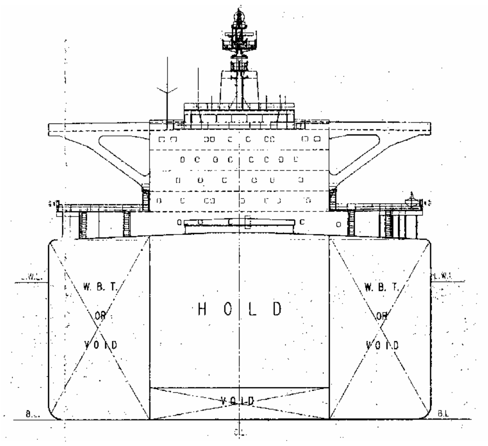
<u>Permsec note (May 2007):</u>
Revisions adopted by GPG 12 April 2007 (5031hIGg).

Attachment:

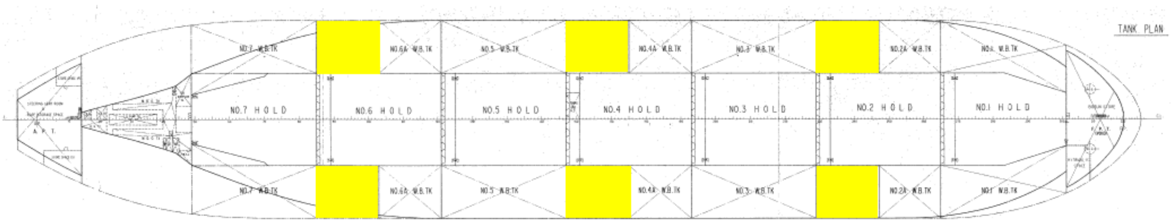
Ore Carriers, Hull Survey Requirements

"Ore carrier" means a single deck ship having two longitudinal bulkheads and a double bottom throughout the cargo region and intended for the carriage of ore cargoes in the centre holds only. Side tanks are generally arranged for the carriage of water ballast.

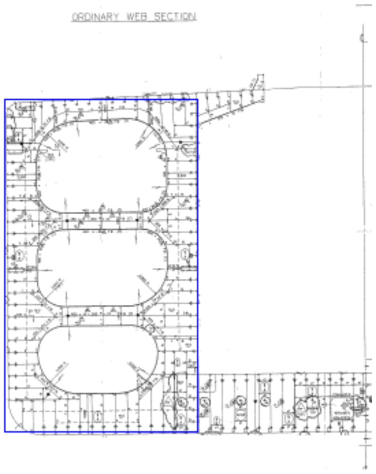
In accordance with UR Z10.5, for close-up surveys of side ballast tanks of ore carriers, the survey requirements of side ballast tanks for oil tankers as given in UR Z10.1 apply.



However, the amount of ballast water required to meet draught requirements for navigation / harbour operations, are generally less than the total capacity of the side tanks.
Hence ore carriers are often designed with several side tanks as void spaces.



The internal structures are generally as for side ballast tanks with transverse web frame rings. The protective coating, if any, may be less durable than coating applied for ballast tanks and the void spaces are exposed to corrosion.



Ore carriers are generally large sized vessels and the overall survey of side void spaces may not be sufficient in order to carry out a meaningful survey for detection of corrosion and other structural defects.

It is proposed to consider minimum requirements for close-up surveys for side void spaces. Requirements given in UR Z10.1 applicable to side cargo tanks may be used as basis.

DNV 2004-10-19

Technical Background

UR Z10.2, Rev.25 (July 2007)
Amendments to 5.3.3 , 5.3.4 and Table 1

(Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions)

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements

2. **Background**

This proposed change was raised by the ABS member from the Survey Panel, due to questions raised by industry.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Due to the many different interpretations of what size a Cape size bulk carrier is, the wording "Cape Size' is proposed to be removed and replaced with "….100,000 dwt and above.", to make the additional requirements very clear, regarding applicability.
All members of the Survey Panel unanimously agreed to this proposed change.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose July 2008 as an implementation date.

Submitted by Survey Panel Chairman
22 June 2007

Permanent Secretariat note (July 2007):
Adopted by GPG with an implementation date of 1 July 2008 on 19 July 2007 (ref. 5031kIGd).

Technical Background

URs Z7(Rev.15), Z7.1(Rev.5), Z7.2(Rev.1), Z10.1(Rev.15), Z10.2(Rev.26), Z10.3(Rev. 9), Z10.4(Rev.6), Z10.5(Rev.8) – November 2007

Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions

1. Objective

To review IACS Resolutions annually and discuss or propose amendments as deemed necessary.

2. Background

This proposed amendment to all URZ7s and URZ 10s was raised by the Panel member from DNV due to Owners crediting tanks concurrently under intermediate and special survey.

3. Methodology of Work

Survey Panel members through correspondence.

4. Discussion

The Panel member from DNV raised the issue of Owners having the ability of crediting spaces and thickness measurements only once in a 54 month interval, due to the availability of concurrent crediting of spaces and thickness measurements due to the flexible time window that is currently allowed between the intermediate survey and the special survey.
After a presentation and discussion lead by the DNV Panel member, all Survey Panel members agreed to the argument given by DNV, and further agreed to make the necessary changes in all URZ7s and URZ10s where Owners are not allowed to concurrently credit surveys and thickness measurements of spaces.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG approve to the amendments, the Survey Panel would propose January 2009 as an implementation date.

Submitted by Survey Panel Chairman
22 October 2007

Permanent Secretariat note (December 2007):

During GPG discussion DNV proposed that *“since this matter will be discussed between Owner and Class mainly in connection with the forthcoming Special Survey, DNV would prefer to locate this text, not only as part of Intermediate Survey, but also as a new text for the Special Survey.”* This was supported by BV, ABS, RINA and KR.

The revised documents were approved, with DNV’s proposal and an implementation date of 1 January 2009, on 15 November 2007 (ref. 7690_IGb).

Technical Background

URs Z7(Rev.16), Z7.1(Rev.6), Z7.2(Rev.2), Z10.1(Rev.16), Z10.2(Rev.27), Z10.3(Rev.11), Z10.4(Rev.7) and Z10.5(Rev.9) - March 2009

Survey Panel Task 62:

A) Harmonization of UR Z10.1, Z10.2, Z10.4 and Z10.5 with UR Z10.3 with respect to items 5.5.4.4 and 5.6.2.

B) Harmonization of UR Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 with UR Z7.2 with respect to the definition of the corrosion prevention system and with respect to the footnote 1 related to semi-hard coatings.

C) Harmonization of the definition of Ballast Tank in UR Z7(Rev.14)

1. Objective

A) Amend the texts of items 5.5.4.4 and 5.6.2 in Unified Requirements Z10.1, Z10.2, Z10.4 and Z10.5 in order to align them with those in UR Z10.3, in which they were changed while performing Task 55, whereas in the other UR Z10s they were kept unchanged on the grounds that this change was out of the scope of Task 55.

B) Amend the definition of “Corrosion Prevention System” and include a Footnote 1 related to semi-hard coatings in Unified Requirements Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 in order to align them with those adopted in UR Z7.2, when this new UR was issued.

C) Amend UR Z7 (Rev. 14) in all items where the term “Ballast Tank” is used in order to get them harmonized with the definition itself.

2. Background

The task, as regards item A), was triggered by a Member Society, while performing Task 55, on the grounds that this part was out of the scope of the task and then should have been dealt with in a separate task.
The task, as regards item B), was triggered as a consequence of the “New Business action item 2” of the Minutes of the September 2008 Survey Panel meting, for sake of harmonization of the various URZs.
The task, as regards item C), was triggered as a consequence of the “Task 54-Examination of Double Bottom Ballast Tanks at annual surveys” of the Minutes of March 2008 Survey Panel meeting, for sake of harmonization of the definition of Ballast Tank in UR Z7(Rev.14).

3. Discussion

The task was carried out by correspondence. All the amended texts for the affected URs were prepared by the Survey Panel Member who had chaired the PT on Task 55, in accordance with the Form A approved by GPG. In addition to the objectives outlined in the Form A, an amendment was added to item 1.3.1 of UR Z10.2 and UR Z10.5 in which the reference 3.2.3.6 in the last item of the list was replaced by 3.2.3.10 as can be correctly verified in the text.
The amended URs were circulated to all Survey Panel Members for review, comments and agreement. The texts of the URs were unanimously agreed by all Members.

4. Implementation

The Survey Panel is of the view that the Member Societies need at least 12 months from the adoption date to implement these amendments into their class rules/procedures. Therefore, in the first version of all amended URs the following implementation sentence should be proposed:

Changes introduced in Rev .xx are to be uniformly applied by Member Societies and Associates for surveys commenced on or after [not less than 12 months after the adoption by GPG/Council].

Since it is common practice and convenience to have implementation dates either on 1st January or on 1st July of the year, the Survey Panel proposes the 1st July 2010 as implementation date, if GPG/Council approve the URs not later than 30 June 2009.

Submitted by Survey Panel Chairman
28 February 2009

Permanent Secretariat notes (April 2009):

1. The amended URs were approved by GPG on 18 March 2009 (ref. 7718bIGd).
2. During the typesetting process it was noted that para 5.1.5 of UR 7.2 was inconsistent with the amended URs and so following consultation with the Survey Panel this was also amended at this time.
3. Regarding the implementation date, GPG agreed to use 1st July 2010 provided that it was consistently used for the amended URs.

Technical Background for UR Z10.2 Rev.28 (Mar 2011)

1. Scope and objectives

1) To amend UR Z10.2 to harmonize the definition of transverse section.

2) Update of references in the Executive Hull Summary Table VII.

3) Correction of "minimum allowable diminution" to "maximum allowable diminution" in Annex II.

4) Review IACS URZ10.2 to determine if there are issues which need to be addressed to ensure that the IACS survey regime and the CSRs are compatible.

2. Engineering background for technical basis and rationale

1) Based on that fact that bulk carriers and oil tankers have a transverse framing system applied for example on ship's sides etc. and that UR Z7 is applied to all types of ships and includes an extended definition of transverse section it is necessary to unify this definition in UR Z10s.

2) Update of references in the Executive Hull Summary Table VII such that the introduction of extended annual surveys is noted in the 'Memoranda' section rather than under 'Conditions of Class'.

3) Correction of "minimum allowable diminution" to "maximum allowable diminution" in Annex II to be consistent with the other UR Z10s.

4) Some requirements in CSRs for Bulk Carriers were relevant to ships in operation and it was decided to move them from CSRs to UR 10.2 in more consistent way.

3. Source / derivation of the proposed IACS Resolution

CSRs, IACS UR Z7 and other UR Z10s.
Proposed amendments to UR Z10.2 is based on internal discussion of IACS which is always striving to produce consistent and compatible rule requirements.

4. Summary of Changes intended for the revised Resolution:

1) The following additional text is added to the definition of transverse section in para 1.2.7:

"For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections."

2) In the Executive Hull Summary Table VII (iv) the reference to part G) is updated to part H) as per Table VII (ii).

3) The wording "minimum allowable diminution" is corrected to "maximum allowable diminution" in Annex II

4) The main amendment has consisted in removing the requirements found in the CSRs related to surveys after construction and locating them in the applicable sections of UR Z10.2. The rationale of that is to have only one place where survey requirements are given and avoid any duplication of requirements in different documents, which would give rise to problems of maintenance and alignment.

Another important amendment has been the requirement for annual examination of the identified substantial corrosion areas for bulk carriers. One Member Society was of the opinion that there should be no difference between the CSRs and non-CSRs bulk carriers. The other Member Societies were of the opinion to consider an alternative examination, which was the original requirement in CSRs, and thus the following text was adopted in UR Z10.2:

“For vessel built under IACS Common Structural Rules, the identified substantial corrosion areas may be:
a) protected by coating applied in accordance with the coating manufacturer’s requirements and examined at annual intervals to confirm the coating in way is still in good condition, or alternatively
b) required to be gauged at annual intervals.”

Other important amendments have been made moving the following items from the CSRs to UR Z10.2 as applicable:
a) the paragraphs regarding the different corrosion patterns, such as pitting corrosion, edge corrosion and grooving corrosion, and their different acceptance criteria,
b) the items regarding the number and locations of thickness measurements, together with the associated table and referenced figures.

Another notable change has been introduced in the "ANNEX II - Recommended Procedures for Thickness Measurements" of UR Z10.2, which, however, are only recommendatory and not mandatory, where thickness measurements forms specific to CSRs single skin bulk carriers have been produced in addition to the existing ones, which only apply to non-CSRs ships.

Finally, for CSRs bulk carriers the requirement has been introduced which stipulates that “the ship’s longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the special surveys carried out after the ship reached 15 years of age (or during the special survey no. 3, if this is carried out before the ship reaches 15 years) in accordance with the criteria for longitudinal strength of the ship’s hull girder for CSRs bulk carriers specified in Ch 13 of CSRs”.

5. Points of discussions or possible discussions

See item 4 above.

6. Attachments if any

None.

Technical Background for UR Z10.2 Rev.29, July 2011

1. Scope and objectives

Review the requirement for repairs within IACS UR 7 and UR 10 series, in particular the requirement for Prompt and Thorough Repair, with a view to developing wording that would permit a temporary repair and the imposition of a Recommendation/ Condition of Class under specific and controlled circumstances, and in accordance with PR35.

2. Engineering background for technical basis and rationale

There are instances, for example a localised, isolated and very minor hole in a cross-deck strip, at which a suitable temporary repair, for example by welding or doubling, and the imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date, are considered very adequate methodology for dealing with the defect.

Current IACS Requirements in the UR Z7 and Z10 series, for Prompt and Thorough repair, would not permit this to be an option, the defect would have to be permanently Promptly and Thoroughly repaired, which might require removing cargo, moving to a repair berth and staging inner spaces.

Under the Requirements of IACS Procedural Requirement PR 35 the methodology of Temporary Repair and imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date is fully permissible.

3. Source / derivation of the proposed IACS Resolution

Based upon discussion within the IACS Survey Panel.

4. Summary of Changes intended for the revised Resolution:

Following the definition of Prompt and Thorough Repair in the Unified Requirement, a new paragraph is proposed to be added:-

"1.3.3 Where the damage found on structure mentioned in Para. 1.3.1 is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the surveyor to allow an appropriate temporary repair to restore watertight or weather tight integrity and impose a Recommendation/Condition of Class in accordance with IACS PR 35, with a specific time limit."

5. Points of discussions or possible discussions

a) The points of discussion are as indicated in Sections 2 and 4 above.

b) Discussion took place on whether to prepare this amendment as a Unified Interpretation of IMO Resolution A.744(18)/UR Z7 and Z10 series, finally it was agreed to make direct amendment to the relevant URs.

c) It is proposed that this amendment be submitted directly to the IMO DE/MSC Committees for consideration of amending directly IMO Res. A744(18)

6. Attachments if any

None

Technical Background for UR Z10.2 Rev.31, Jan 2014

1. Scope and objectives

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.
b) To align the requirements in PR37 and UR Z10s regarding safe entry to confined spaces.

2. Engineering background for technical basis and rationale

a) As per the IMO Res. A1053 (27), lengthy conversions (not necessarily of major character) or other major repair work can be assigned for a 5 year period from the date of completion of conversion/repairs/surveys.
b) Safety requirements in IACS PR37 can be applied to carry out survey in safe way for all kind of ships. When there are no indications about the safety of surveyor in UR Z10s then the requirements in PR37 shall be applied.

3. Source/derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

a) Following additional text was included to section 2.1.3 to clarify the class period for lengthy conversions

"In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date."

b) Existing Section 5.2.6 and 5.2.7 were deleted from UR Z10s since provisions of these sections were covered by PR37. Reference of PR37 was included in Section 5.2.1.1.

5. Points of discussions or possible discussions

i) Additional text to Para.2.1.3 was discussed in order to clarify class period.
ii) Panel considered that safety of surveyors should be dealt by PR37.

6. Attachments if any

None

UR Z10.3 "Hull Surveys of Chemical Tanker"

Summary

In revision 21 of this UR, the reference of Owner's Inspection Report has been added in Section 6.3.1 (Supporting Documents) to update this UR and to improve the consistency with the other UR Z10s.

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Rev.21 (Aug 2023)	04 August 2023	1 July 2024
Rev.20 (May 2022)	03 May 2022	1 January 2023

New (1996)	May 1996 at C33	1 July 2007

*** Notes:**

1. *Paragraph 4.2.4.3 is newly introduced in Rev.5 in accordance with Res.MSC 105(73) and is to be implemented from 1 July 2002. The other changes introduced in Rev.5 are to be implemented within one year of the adoption by Council.*

- **Rev.21 (August 2023)**

.1 Origin of Change:

- Suggestion by an IACS member

.2 Main Reason for Change:

An update of this UR to improve the consistency with UR Z10.4.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

IACS decided to update this UR to improve the consistency with the outcome of previous work to revise other UR Z10s by including the reference of Owner's Inspection Report in its Section 6.3.1 (Supporting Documents).

.5 Other Resolutions Changes:

None

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal:	24 February 2023	(Instructed by GPG via 22198_IGe)
Panel Approval:	20 July 2023	(22198_PYb)
GPG Approval:	04 August 2023	(22198_IGg)

- **Rev.20 (May 2022)**

.1 Origin of Change:

- Based on IMO Regulation (MSC.Res.483(103))
- Suggested by IACS Member

.2 Main Reason for Change:

To amend the minimum requirements of Thickness Measurements at Special Survey No.1 in line with the amendments made to ESP Code vide Res. MSC.483(103).

To make definition of ballast tanks in UR Z10s in line with other IACS Resolutions

.3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

.4 History of Decisions Made:

- One survey panel member raised issue regarding requirements for thickness measurements at Special Survey No.1. Some require deck plating and measurements for general assessment of items subject to close-up surveys (tankers, chemical carriers, gas carriers) while others only require suspect areas (bulk carriers, ESDC, all Z7 vessels). With PSPC, there should be no wastage in ballast spaces at SS No. 1.

Noting that the mandatory requirement for the coating of cargo oil tanks of Regulation 3-11 of Chapter II-1 of SOLAS was adopted by Res. MSC. 291(87) and entered into force, panel members agreed to remove the requirements of thickness measurements in cargo oil tanks (items 2 and 4) of Special Survey No.1 in the Table II, and agreed to collect data from members about the results of the SS1 of enough vessels with the conditions about wastage, deficiencies in the areas relevant to the survey items 2 and 4 of SS1 in the Table II of UR Z10s.

Totally, 157 Double Hull Oil Tankers were collected and members concluded that based on the analysis to the datas collected by IACS members, it is concluded that the requirements of thickness measurements in cargo oil tanks (items 2 and 4) of Special Survey No.1 in the Table II of UR Z10.3 and Z10.4 could be removed, after a submission to IMO to amend the relevant contents of ESP Code being adopted.

It was submitted to SDC 7 and adopted as MSC.Res.483(103).

- One survey panel member pointed out that the definition of ballast tanks in UR Z10s are different from other IACS Resolution (UR Z7/Z7.1/Z7.2) and ESP Code. Survey panel reviewed and agreed to change "solely" to "primarily" in UR Z10s.

No TB is expected for the present revision.

.5 Other Resolutions Changes:

None

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal	: 01 March 2018	(Ref: PSU18011)
	28 January 2020	(Ref: PSU20004)
Panel Approval	: 11 April 2022	(Ref: PSU21024)
GPG Approval	: 03 May 2022	(Ref: 22043_IGb)

- **Rev.19 (May 2019)**

.1 Origin of Change:

  - Suggestion by an IACS member

.2 Main Reason for Change:

This revision is to address the policy decision made by GPG using the common terminology 'Condition of Class'(CoC) instead of the terms 'Recommendation/ Condition of Class' based on the outcome of III 5.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

During the 29th panel meeting, the panel discussed about the comments of members, and concurred with the view to retain the present definitions of CoC in the IACS resolutions with the wording 'Recommendation' to be removed. The panel also agreed to use the term 'Statutory Condition' for the 'recommendation' of the statutory certificates in IACS resolutions and RECs, and when discussing the proposal of a member to consider the harmonization of the terms of 'recommendation' and 'condition of class' in RO Code, the panel unanimously agreed to take no action on the IMO instruments, leaving the relevant actions to be decided by the relevant IMO bodies when IACS feeds back to IMO the IACS action on the harmonization of the two terms.

Panel members concurred with the view that it is not necessary to develop a new procedure requirement, and agreed to set the implementation date of these IACS resolutions (other than RECs) as 1st July 2020.

Before the implementation date of 1st July 2020 for using the common terminology 'Condition of Class' only, 'Recommendations' and 'Condition of Class' are to be read as being different terms used by Societies for the same thing, i.e. requirements to the effect that specific measures, repairs, surveys etc. are to be carried out within a specific time limit in order to retain Classification.

No TB is expected for the present revision.

.5 Other Resolutions Changes:

The following IACS resolutions and Recommendations (RECs) were agreed to be revised:
- Procedural Requirements: PR1A, PR1B, PR1C, PR1D, PR1 Annex, PR3, PR12, PR20, PR35 and the attachment of PR16;
- Unified Requirements: Z7, Z7.1, Z7.2, Z10.1, Z10.2, Z10.3, Z10.4, Z10.5, Z15 and Z20
- Unified Interpretations: GC13
- Recommendations: Rec.41, Rec.75, Rec.96, Rec.98

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal: 14 January 2019 tasked by GPG (17044bIGm)
Panel Approval: 22 March 2019 (PSU19010)
GPG Approval: 30 May 2019 (17044bIGu)

- **Rev.18 (Jan 2018)**

.1 Origin of Change:

☑ Suggestion by IACS members

.2 Main Reasons for Change:

To address the FUA 11 of C73, raised by the Council of the IACS in respect to the future work directions on the implications of new technology on survey regime. A revision of UR Z10.3 is in order to consider the new technologies on Remote Inspections (RIT).

In order to introduce new provisions into the ESP Code which were found among the ESP Code and relevant URZ10s, a series of items of UR Z10s shall be amended accordingly with ESP Code.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Members discussed under Panel task PSU16056 the issue allocated by GPG on 21th October 2016. The subject deals with the review of the UR and Recommendation under Panel responsibility in order to determine whether a revision could need in order to consider the new technologies on Remote Inspections (RIT). The Panel Members concurred to discuss the possible revision of the UR Z10.3 in order to address the issue.

Panel agreed the revised paragraph 1.5 and 5.3.3. In addition, a new paragraph 1.2.15 with definition of RIT was agreed and inserted in the present revision of UR Z10.3.

Panel members discussed this issue under PSU17018 about the proposals of: deleting the superseded Table and renumbering the current table; "Thickness measurement company" was to be replaced with "Thickness measurement firm" throughout the UR; some paragraphs were to be revised for the alignment with other UR Z10s; etc.

During the 26th Survey Panel Meeting, the Panel discussed the divergence and reached agreements with the revisions.

No TB is expected for the present revision.

.5 Other Resolutions Changes

UR Z10.1, UR Z10.2, UR Z10.4, UR Z10.5, UR Z3, UR Z7, UR Z17

.6 Dates:

Original Proposal: 22 October 2016 by a Survey Panel Member
Panel Approval: 24 December 2017 by Survey Panel (Ref: PSU16056 & PSU17018)
GPG Approval: 15 January 2018 (Ref: 17189_IGc)

- **Rev.17 (Feb 2015)**

.1 Origin of Change:

☑ Suggestion by IACS members

.2 Main Reasons for Change:

a) To consider appropriate text in IACS document regarding the applicability of the Thickness Measurements when the Close up survey is performed.
b) Modification of Table II MINIMUM REQUIREMENTS FOR THICKNESS MEASUREMENTS AT SPECIAL SURVEY FOR CHEMICAL TANKERS
c) Modification of the wording of note 7 in table I.2 as appropriate, in order to consider also the structures associated to corrugated bulkheads.
d) To specify the minimum content of the Tank Testing guideline cited at paragraph 2.5.1.bullet a).

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) Following an ACB query an IACS member proposed to add suitable text in appropriate IACS documents regarding the application of the Thickness Measurements when the close up surveys are performed as survey requirement due at the Intermediate/ Renewal Class surveys. This Member expressed the view that the requirements to execute the Thickness Measurements of the area subject to Close Up Surveys are expected into the table relevant to “MINIMUM REQUIREMENTS FOR THICKNESS MEASUREMENTS AT SPECIAL SURVEY ………” while the paragraph 1.4 of the document contains only the requirement that “Thickness Measurements of the areas subject to close up surveys shall be taken in conjunction with the close up survey”.

Panel discussed the matter under item PSU13051 and considered that wordings of Para 1.4 of current UR Z7s/10s need to be revised in order to clarify the issue.

b) An IACS member noted that table II relevant to "MINIMUM REQUIREMENTS FOR THICKNESS MEASUREMENTS AT SPECIAL SURVEY FOR CHEMICAL TANKERS" did not recalled correctly the tables of the close up surveys. In fact the table II was recalling generically table I while it should be necessary specify table I.1 table I.2 as applicable, being two separate tables for Chemical tankers and Double Hull Chemical Tankers in the UR Z10.3. According to the highlight Member proposed the modification of table II of UR Z10.3

c) An IACS Members proposed to modify the note 7 of table I.2 relevant to the structure of the longitudinal bulkheads in order to consider also the case where corrugated bulkheads are fitted. Being the structural arrangement of the corrugated bulkhead quite different from that of the plain bulkheads, the wording "longitudinal bulkhead vertical girder" was applicable only to plain bulkhead being the vertical girder not existing or differently realised for the corrugated type. Panel agreed to modify the wording from the existing one to "longitudinal bulkhead structural members".

d) An IACS Member following the discussion of PSU 14017 (relevant to the drafting of a Guidelines for Master tank testing) proposed to improve the content of the bullet a) of paragraph 2.5.1 of the UR by inserting the description of the minimum requirements that need to be specified inside the "Cargo Tank Testing Procedure" to be used when Master of a Tanker is allowed to perform the cargo tank testing. Panel concurred with the proposal (ref, message PSU14017…ISUc).

Considering items a), b) c) and d) Panel agreed

1) to add additional wording to Para.1.4;
2) to modify table II of UR Z10.3
3) to modify note 7 of table I.2
4) to modify sentence of bullet a) of paragraph 2.5.1. as follow:

   "a tank testing procedure<u>, specifying fill heights, tanks being filled and bulkheads being tested,</u> has been submitted by the owner and reviewed by the Society prior to the testing being carried out";

.5 Other Resolutions Changes

i) The amendment a) affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.2, UR Z10.4, UR Z10.4 and UR Z 10.5.
ii) The amendment c) affects also UR Z10.4
iii) The amendment d) affects also UR Z10.1, UR Z10.5

.6 Dates:

Panel Approval: Amendment a) and b) at 19th Survey Panel Meeting (6 March 2014).
Amendment c) by correspondence under PSU13051
Amendment d) on 29 July 2014 by correspondence under PSU14017

GPG Approval: 05 February 2015 (14193_IGc)

- **Rev.16 (Jan 2014)**

.1 Origin of Change:

☑ Suggestion by IACS members
☑ Suggestion by GPG

.2 Main Reason for Change:

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.

b) To align the difference between PR37 and URZ's regarding safe entry to confined spaces.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) With reference to IMO Res. A1053 (27) (5.5 Application of "special circumstances") an IACS member proposed to add suitable text in appropriate IACS document regarding class period for lengthy conversions. This Member expressed that when a renewal survey has been completed, the new 5 year class period would normally be calculated from the expiry of previous class period/class certificate and in some cases this might result in unreasonably short time from one renewal survey completion until the next renewal would be due.

Panel discussed and considered that wordings of Para 2.1.3 of current UR Z7s/10s (second sentence) could address this issue but finally agreed to add additional text to Para 2.1.3 in order to clarify this matter. (PSU13024)

b) Panel discussed to clarify the survey requirements in PR37 and URZ's regarding safe entry to confined spaces. Panel considered that the safety issues of surveyor should be dealt by PR37. At 18th Panel meeting, Panel concluded to delete requirements from UR Z10s which were already covered by the PR37. (PSU13032)

.5 Other Resolutions Changes

a) The identical amendment affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.2, UR Z10.4 and UR Z 10.5.
b) The identical amendment affects UR Z10.1, UR Z10.2, UR Z10.4 and UR Z 10.5.

.6 Dates:

Panel Approval: 7 November 2013 by Survey Panel

GPG Approval: 14 January 2014 (Ref: 12011aIGd)

- **Rev.15 (May 2013)**

.1 Origin of Change:

☑ Suggestion by an IACS Member
☑ Suggestion by GPG in response to the request of EG/SoS

.2 Main Reason for Change:

a) An inquiry from a member whether the 'Other equivalent means' referred in Para 5.3.2 of IACS UR Z10.2 include the use of Cherry Pickers for survey of other structures. (PSU 12022)
b) To introduce provision in UR Z10s that Rescue and emergency response equipment must be suitable for the configuration of the space being surveyed including the size of the access points.(PSU 12032, GPG 12138_)
c) To amend paragraph 2.5 to keep in line with the draft amended texts of UR Z10.1 and UR Z10.4.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) Discussion of this matter initiated by a Panel member regarding the use of Cherry Pickers in Cargo Holds with reference of IACS URZ10.2. In accordance with UI SC191 and Rec 91, the Cherry Picker is allowed up to 17m height for Cargo Hold structure (ships constructed after 2006 for Alternative means of access). As per the provisions of URZ10.2, Cherry pickers are allowed for survey of side shell frames only.

   Panel discussed and considered that Para 5.3.2 of UR Z10.2 allows the use of Cherry Pickers as 'Other equivalent means'. Accordingly, Panel agreed to clarify this matter by including text "hydraulic arm vehicles such as conventional cherry pickers" to UR Z10s and UR Z7s for a ship not subject to the above 17m restriction.

b) GPG Chairman requested to consider the suggestion of EG/SoS to clarify the wording in UR Z 10.1 – 10.5 to make it compliance with draft PR37 submitted by EG/SoS.

   The Survey Panel discussed this matter and introduced a new (sub-)section 5.5 "Rescue and emergency response equipment" in line with the suggestion of EG/SOS.

c) A GPG member suggested to amend paragraph 2.5 to keep in line with the draft amended texts of UR Z10.1 and UR Z10.4 and this was agreed by GPG.

.5 Other Resolutions Changes

a) The identical amendment affects UR Z7, UR Z7.1, UR Z10.1, UR Z10.2, UR Z10.4 and UR Z 10.5
b) The identical amendment affects UR Z10.1, UR Z10.2, UR Z10.4 and UR Z 10.5
c) The identical amendments affects UR Z10.1 & URZ10.4

.6 Dates:

Panel Approval: 7 March 2013 during Survey Panel Meeting
GPG Approval: 22 May 2013 (Ref: 9640_IGn)

- **Rev.14 (August 2012)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reason for Change:

To modify the figures showing areas for close up surveys, i.e. Fig.2.1, 2.2 and Fig. 3.1-3.3 in Rev.13, as they are different from typical transverse sections of chemical tankers.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

A member pointed out that figures showing areas for close up surveys, i.e. Fig.2.1, 2.2 and Fig. 3.1-3.3 seem not to be suitable for chemical tankers because they are different from typical transverse sections of chemical tankers. The member proposed that the above-mentioned figures should be modified to show typical transverse section of chemical tanker such as Fig. 6 of UR Z11, in order to avoid any confusion.

Survey Panel developed the updated the figures and submitted the corrected UR for GPG approval.

GPG agreed to consider this is a revision with an implementation date of 1 July 2013 to provide members with sufficient time to complete the UR implementation process.

.5 Other Resolutions Changes

None

.6 Dates:

Original Proposal: *19 July 2011 Made by a Member*
Panel Approval: *26 June 2012*

GPG Approval: *20 August 2012 (Ref: 10079aIGj)*

- **Rev.13 (July 2011)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reason for Change:

Following external audit a member was advised that a small temporary doubler on a cross-deck strip of a bulk carrier should have been promptly and thoroughly repaired at the time of survey. The member carried out an investigation and found that the actions of the surveyor were fully justifiable, the temporary repair and short term Condition of Class imposed were an appropriate method of dealing with such a situation. The member advised that the current requirements for 'Prompt and Thorough Repair' stipulated under the UR 7 and UR 10 series do not give any leeway for carrying out temporary repairs (and imposing a Recommendation/Condition of Class in accordance PR 35) where the damage in question is isolated and localised, and in which the ship's structural integrity is not impaired.

The Survey Panel discussed the matter and agreed that under carefully defined circumstances a temporary repair and short term Recommendation/Condition of Class would be an appropriate course of action.

Also, Table I was split to into 2 tables for enhanced clarity, Table I.1 for Single Skin and Table I.2 for Double skin ships and miscellaneous editorial errors in the Table I.1 and I.2 are corrected.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

The matter was discussed by correspondence within the Survey Panel and at the Autumn 2010 Panel Meeting. Following discussion at which the possibility of a Unified Interpretation being raised was considered, it was eventually decided to make direct amendment to the relevant Unified Requirements.

The wording of the new paragraph to be inserted as Para 1.3.3 in all relevant Unified Requirements was extensively discussed prior to agreement.

The proposal was unanimously agreed by Survey Panel Members.

.5 Other Resolutions Changes

The identical amendment affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.2, UR Z10.3, UR Z10.4 and UR Z 10.5.

.6 Dates:

Original Proposal: *September 2010 Made by a Member*
Panel Approval: *March 2011*
GPG Approval: *28 July 2011 (Ref: 10079aIGe & 11118_IGb)*

• Rev.12 (Mar 2011)

.1 Origin for Change:

☑ Suggestion by IACS member

.2 Main Reason for Change:

1) Due to the fact that the figures showing areas for close-up survey were deleted in Rev.10 of UR Z10.3 and that Table I of UR Z10.3 only has references to zones marked as A-D which are covered by the figures shown in UR Z10.1, references to zones 1-7, as shown in URZ10.4, should be added to Table I of UR Z10.3.

2) Inconsistency of the definition of transverse section of the ship given in UR Z7 and UR Z10s.

3) Update of references in the Executive Hull Summary Table IX.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None.

.4 History of Decisions Made:

Items 1) and 2) were proposed by RS and item 3) was proposed by GL. All amendments were agreed by the Panel.

.5 Other Resolutions Changes

UR Z10.1, Z10.2, Z10.4 and Z10.5.

.6 Dates:

Original Proposal: *January 2010, made by Survey Panel*
Survey Panel Approval: *July/November 2010*
GPG Approval: *24 March 2011 (Ref: 10170_IGe)*

Technical Background Document
UR Z10.3 – Revision 3
For ExCM decisions

Objective and Scope:

Revise UR Z10.3 to introduce ExCM (Extraordinary Council Meeting in Feb 2000) decision to UR Z10's

- ExCM FUA 2-1: All ballast tanks adjacent to cargo tanks with heating coils shall be examined internally on an annual basis after the ship has reached 15 years of age.
- ExCM FUA 2-2: Intermediate surveys of ships subject to ESP, which are over 15 years of age, will be enhanced to the scope of the preceding special survey with dry docking or under water survey as applicable.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC Chairman, shortly after GPG 48th meeting:

- The para. 3.2.5.2 for ExCM FUA 2-1:
- The para. 4.2.2, 4.2.3 & 4.2.4 for ExCM FUA 2-2.
- The paragraph 7.1.1 for compatibility with the PR 19 (ABS GPG proposed)

Points of Discussion:

-

Unresolved Comments:

-

Discussions:

WP/SRC Chairman, when submitting draft revision to GPG, raised the following concerns:

- What tanks are required by the term "ADJACENT" ?

  WP/SRC Chairman said that tanks with a common line boundary have not been a problem since there is very little transfer of heat and should not be included.

  GPG exchanged views on this point and agreed to delete the wording "or line" from the para. 3.2.5.2 which reads: Oil Tankers exceeding 15 years of Age: All Ballast Tanks adjacent to (i.e., with a common plane ~~or line~~ boundary) a cargo tank with heating coils is to be examined internally.
- Identify tanks with heating coils

  WP/SRC Chair said that the vessel's survey status does not tell us tanks fitted with heating coils.
- Coating Condition and Substantial Corrosion Survey Requiremnets

  Ballast tanks with poor coating, no coating or substantial corrosion identified at a previous survey already requires annual survey. With enhanced intermediate survey, all

Submitted by the Permsec
On 19 July 2000

ballast/cargo tanks will be examined and gauged at special/intermediate survey and coating condition & substantial corrosion should be identified at that time. If coating condition is reported good or fair, it may be adequate to only verify the coating condition at annual survey of ballast tanks adjacent to cargo tanks fitted with heating coils.

In addition, DNV and LR (GPG) proposed the following additions:

- The 3rd sentence in para. 3.2.5.2 (DNV):

  "Tanks or areas where coating was found to be in GOOD condition at the previous intermediate or special ~~internal examination are to~~ survey may be be specially considered by the Classification Society."

  The majority GPG agreed.

- The second half of the para. 4.2.4.1(LR)

  "except that testing of cargo and ballast tanks is not required unless deemed necessary by the attending surveyor."

  The majority GPG agreed.

- The paragraph 7.1.1 of Z10.1 and Z10.3, paragraph 8.1.1 of Z10.2 were revised for their compatibility with the PR 19 "PR for Thickness Measurement".

Submitted by the Permsec
On 19 July 2000

Technical Background Document
WP/SRC Task 77
UR Z7 – Proposed Draft Revision 7
(Including Rev.8 of Z10.1, Rev.11 of Z10.2, Rev.4 of Z10.3)

Objective and Scope:

Extend the requirements for permanent repairs at the time of survey in UR Z 10.2 to all ships.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC members through correspondence and discussions at the September 2000 meeting.

Points of Discussion:

UR Z7 was amended to apply "prompt and thorough" repairs to all vessels. The new wording defines a prompt and thorough repair to be a repair as a result of wastage and not an incident such as contact damage where a temporary repair or deferral of repairs could be permitted. This wording is more explicit than the wording in UR Z10.2 and should achieve a uniform application among the Members.

WP/SRC also agreed to include these requirements in Z10.1, Z10.2 and Z10.3 in order to not effect A.744(18).

WP/SRC unanimously agreed to the draft UR.

Note by Permsec

GPG 49 (11-13 Oct. 2000) agreed that the same changes be introduced to Z10's and carried out editorial review of Z 10's.

Technical Background Document
WP/SRC Task 75
UR Z10.1 – Proposed Draft Revision 8
&
Z10.3 – revision 4

Objective and Scope:

Develop a definition of 'related piping' as contained in UR Z10.1 and requirements for survey.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC members through correspondence.

Points of Discussion:

The proposal limits the definition of "related piping" to the piping systems which require testing. This will not include hydraulic oil piping for remote control valves or anchor/mooring equipment which OCIMF may have wanted included. WP/SRC feels that related piping systems are those that are unique to an oil carrier and was the original intent of the wording.

WP/SRC unanimously agreed to the draft UR.

Note by the Permsec:

LR GPG proposed to change Z10.1 as follows:

> "piping systems for the handling of cargo / cargo residues and water ballast and additionally bilge systems in combination carriers. 8220iLRa, 30/8/2000"

GPG Chairman asked WP/SRC to discuss LR's proposal to include "bilge piping systems" in Z10.1 at their 2000 September meeting.

WP/SRC Chairman reported back to GPG on 22 September 2000 as follows:

> 1. "Cargo piping" adequately covers and is understood by all members to include cargo stripping piping, just as "Ballast piping" includes ballast stripping piping.
>
> 2. WP/SRC is of the opinion that bilge piping on combination carriers should not be added to the proposed revision due to the fact that it is a separate system which usually run through a pipe tunnel and is not hydro tested at new construction. The system also operates on a vacuum and is blanked off when oil is carried.
>
> Therefore, WP/SRC maintains its agreement that the previously submitted text is the preferred by all members.

GPG agreed that a similar amendment be made to Z10.3.

Based on the above discussion at GPG level, the revised of Z10.1 and Z10.3 was finally approved at GPG 49.

Submitted by WP/SRC Chairman

On 27 July 2000

(This view was shared by the majority of GPG Members, however, it has not been codified in Z 10.1 because no need was identified to prescribe it as a Unified Requirement.)

- Identify tanks with heating coils

  WP/SRC Chair said that the vessel's survey status does not tell us tanks fitted with heating coils.

- Coating Condition and Substantial Corrosion Survey Requiremnets

  Ballast tanks with poor coating, no coating or substantial corrosion identified at a previous survey already requires annual survey. With enhanced intermediate survey, all ballast/cargo tanks will be examined and gauged at special/intermediate survey and coating condition & substantial corrosion should be identified at that time. If coating condition is reported good or fair, it may be adequate to only verify the coating condition at annual survey of ballast tanks adjacent to cargo tanks fitted with heating coils.

In addition, DNV and LR (GPG) proposed the following additions:

- The 3rd sentence in para. 3.2.5.2 (DNV):

  "Tanks or areas where coating was found to be in GOOD condition at the previous intermediate or special ~~internal examination are to~~ survey may (ABS' comment) be specially considered by the Classification Society."

  The majority GPG agreed.

- The second half of the para. 4.2.4.1(LR)

  "except that testing of cargo and ballast tanks is not required unless deemed necessary by the attending surveyor."

  The majority GPG agreed.

- The paragraph 7.1.1 of Z10.1 and Z10.3, paragraph 8.1.1 of Z10.2 were revised for their compatibility with the PR 19 "PR for Thickness Measurement".

Technical Background for

<u>Rev.8.1, Z10.1</u>

<u>Rev.11.1, Z10.2</u>

<u>Rev.4.1, Z10.3</u>

(21 June 2001)

1. Scope of objectives

Revise section 2.3.1 for clarity.

2. Points of discussions or possible discussions

- BV GPG member proposed to revise section 2.3.1 of Z10s on 12 June 2001 (0065j)

- IACS Council considered the ambiguity of the sentence in Special Survey section 2.3.1 “For Fuel Oil Tanks the necessity for the Overall Survey is to be determined based on the ship’s age” in the context of its application at intermediate surveys on ships over 15 years. Council agreed that the overall survey of low corrosion risk tanks such as fuel oil, lube oil and fresh water tanks could be subject to special consideration as already addressed in section 2.2.5 of UR Z7 and therefore amended the first sentence of 2.3.1, accordingly, and deleted the last sentence of 2.3.1.

- Adopted on 21 June 2001.

* * * * *

Technical Background Document
WP/SRC Task 87
Amend Z10.1&10.2 to reflect changes introduced to Res A.744 by MSC 73
(Z10.1, Rev.9) + (Z10.2, Rev.12) + (Z10.3, Rev.5)

Objective and Scope:

To harmonise IACS UR Z10.1 and Z10.2 with IMO Res A744(18), as previously amended and as amended by IMO MSC105(73) and MSC 108(73).
These amendments enter into force 1 July 2002.
It was assumed by WP/SRC that the intention of GPG has been to revise UR Z10.3 (chemical tankers) as well with respect to the intermediate dry-docking requirement, but not to include the requirement to evaluation of longitudinal strength.
In addition, the relevant changes to UR Z10.1 based on the changes introduced in IMO Res A744(18) as reported in MSC 74/24/Add1-Annex 17 have been included. These were based on IACS submission DE 44/13/1. These amendments will enter into force 1 January 2004 subject to IMO tacit acceptance procedures.

POINTS OF DISCUSSION:

The Chairman of WP/SRC would further draw GPG's attention to paragraph 4.2.4.3, which contains the requirement to intermediate dry-docking for oil tankers exceeding 15 years of age. The corresponding Res.A 744(18) requirement (paragraph 2.2.2) does not link the dry-docking to the intermediate survey. This issue was discussed extensively by correspondence and during three WP meetings this year. A consensus decision was achieved without reservations from any members. This process was time consuming, hence the delay in submitting this document to GPG for approval. However, at the annual meeting of the WP in October 2001 all members agreed that we should not accept the wording of Res. A 744(18) paragraph 2.2.2, but instead require that the intermediate dry-docking is to be linked to the intermediate survey and include a requirement to carry out surveys and thickness measurements of the lower portions of the tanks for oil tankers. (similarly, cargo holds/water ballast tanks for bulk carriers)

GPG is advised to note that the proposed requirement in paragraph 4.2.4.3 may result in a third dry-docking within the 5-year period of the classification certificate in case that a dry-docking is carried out prior to the window for intermediate survey.

The Chairman of WP/SRC suggests that GPG approves UR Z10.1 with high priority and allows PermSec in the meantime to start the work to amend and typeset UR Z10.2 and URZ10.3 with respect to the intermediate dry-docking requirement, as well as introducing the appropriate changes to UR Z10.2 and UR Z10.3 with respect to MSC 74/24/Add 1-Annex 17.

Note:

1. GPG tasked WP/SRC to review dry-docking survey requirements in Z10.2-4 and Z3 to harmonize them with those in Z10.1 (Rev.9) and reflect in Z3 the interim application of bottom survey requirements as introduced in MSC/Circ. 1013 (Res A.746(18)).

   Task 101, Target 2Q-2002

2. GPG confirmed (s/n 1060c) that 7.1.3 of A.744(MSC 74/12/Add.1/Annex 17/page 6), as quoted below, should not be included in Z10s.

   "7.1.3 Thickness measurements are to be carried out within 12 months prior to completion of the periodical survey or of the intermediate survey."

   Reason: The above sentence will restrict the 15 month and 18 month survey window for TM during the intermediate and special surveys respectively.

3. GPG confirmed that 7.1.4 of A.744(MSC 74/12/Add.1/Annex 17/page 6), as quoted below, should not be included in Z10s:

   "7.1.4 In all cases the extend of the thickness measurements should be sufficient as to represent the actual average condition."

   Reason: No compelling need, in view of MSC 74/12/Add.1 being adopted by MSC 75(May 02). IACS will live with this not harmonized sentence.

4. For IACS Council decisions to improve bulk carrier safety, see the TB for Revision 12 of Z10.2.

Submitted by WP/SRC Chairman

WP/SRC Task 102
HARMONIZATION OF UR Z7s AND Z10s

Technical Background
UR Z7 (Rev. 11)
UR Z7.1 (Rev. 2)
UR Z10.1 (Rev. 12)
UR Z10.2 (Rev. 17)
UR Z10.3 (Rev. 7)
UR Z10.4 (Rev. 2)
UR Z10.5 (Rev. 1)

Contents:

1. Objective

To amend UR Z7s and Z10s in order to make the texts of the above-mentioned URs consistent eliminating all the differences both in substance and in wording (WP/SRC Task 102).

2. Background

In the process of approving UR Z10.4, GPG found it necessary to amend the other existing URs Z10.1, Z10.2, Z10.3, Z10.6 and Z7 in order to eliminate any inconsistencies existing among them.

3. Methodology of work

The WP has progressed its work through many sessions, both during the periodical meetings and dedicated meetings restricted to a Small Group of Members (BV, DNV, GL, LR, RINA) who developed the work in order to be more efficient. All the proposed amendments of the Small Group have regularly been circulated to all Members for comment and agreement.

4. Discussion

4.1 The WP/SRC has completed a comprehensive comparative review of UR Z7 and Z10s, and identified inconsistencies which existed among them. During this review, attention was given to the severity of the requirements applicable to the same spaces/structural areas on different types of ESP ships. As a result, the inconsistencies were eliminated making the URZs harmonized. However, there has been no change to the scope and extent of the survey requirements.

4.2 The starting point for each UR was the most updated version available at the time of commencement. Any revision to the URZs, which were introduced during this task, was taken into account. As for instance, the UR Z10.1 was initially amended based on Rev. 9, while the last amendments are based on Rev. 11 and the UR Z10.2 was initially amended based on Rev. 13, while the last amendments are based on Rev. 16. The proposed revisions of URs Z10.1 and Z10.4 have not been numbered, as there will be revisions to those URs before the revisions introduced by the Task 102 are adopted. In fact, GPG is currently developing a Revision 12 of Z10.1 with the view to introducing significant improvements in the survey regime for ballast tanks (including combined cargo/ballast tanks) of oil tankers and UR Z10s applicable to oil tankers will also have to be revised by incorporating the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005 (see 4.3 below).

4.3 Also, in harmonizing UR Z10.1 and Z10.2 care has been taken to align the corresponding text with that of IMO Res. A.744(18). However, it has been noted that the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005, have not been incorporated into the IACS UR Z10s applicable to oil tankers. It seems that the updating of the above-said UR Z10s will be done by the Perm Sec and reviewed by the WP/SRC Chairman and then circulated for adoption by GPG with concurrence of Council Members for uniform application from 1 January 2005. It is understood that the revisions of the UR Z10s affected by those amendments will not include the changes introduced by the Task 102, as the implementation date proposed for those changes is 1 January 2006 (see below **6. Implementation**).

4.4 In the course of the work the WP has been developing for more than two years, several additional Tasks were assigned to the WP by GPG which affected the development of Task 102. The additional tasks which have been taken into account are the following:

1) In the course of Council discussion on UR Z10.6 (General Cargo Ships), certain inconsistencies were identified between Z10.6 and other Z10s. WP was instructed to expedite Task 102 (1060gIAa, 12 June 2002);
2) WP was instructed to include “Survey Planning for Intermediate Survey” into harmonization work (2108_IAa, 12 July 2002);
3) GPG instructed WP to consider whether Z10.6 should be re-assigned as Z7.1, in connection with the harmonization work. 1060gIAb, 20 Sept 2002.

Z7.1 developed;

4) Partial outcome (Z7 and Z7.1) was submitted to GPG on 17 July 2003(1060g). Council decided that approval of Z7(Rev.10) and Z7.1(Rev.2) is postponed until the harmonization is completed (1060gICb, 6 April 2004); Council Chairman instructed WP/SRC to Members' comments on the draft revision of UR Z7 and Z7.1 (collected under s/n 1060g, 1060gNKi (30/03/2004) in particular) on 6 April 2004.

5) GPG tasked WP to include the amendments to Z10.2 / Z11 (BCs with hybrid cargo hold arrangements), deleting sheets 15 and 16 for ore carriers, into the harmonized UR Z10s (2212aIGa, 19 Jan 2004);
6) GPG tasked WP to consider whether the requirements relevant to examination of Fuel Oil Tanks in the cargo area at each Special Survey should be put into Z 10s, and internal examination of FOT at Intermediate Survey after SS 2 is needed. (1060gIAf, 30 Jan 2004);
7) GPG tasked WP to harmonize tank testing requirements in Z7s and Z10s. (3006lIAa, 5 April 2004);
8) GPG tasked WP with Task 108 - Develop uniform survey requirements for air vent pipes including the welded connection to deck. Z22 developed. GPG instructed WP to incorporate Z22 into the harmonized Z10s;
9) GPG tasked WP with Task 114 - Verification and signature of TM reports. REC 77(Rev.1) developed and approved on 29 July 2004. Council approved parallel amendments to Z7.1 and Z10s (TM Forms included) and instructed WP to incorporate these into the harmonized Z10s:
    - Recommendation No.77 was revised (Rev.1, July 2004);
    - Z7.1 para.6.3.2 and Z10s para.7.3.2 so amended.
    - "Surveyor's signature" is deleted from all TM Forms in Z10s;
    - A note is added to Annex II(Z10s) declaring that Annex II is recommendatory.

   WP/SRC's investigation into Members' practice in dealing with verification and signature of TM reports is annexed for record keeping purpose. See Annex 2.

10) GPG tasked WP to consider the BV comments on "TM may be dispensed with…." and include the findings into the harmonized Z10s (2219iIAa, 7 April 2004).

5. Agreement within the WP/SRC

All Members have unanimously agreed the attached final versions of UR's.

6. Implementation

WP/SRC is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming Council adoption in December 2004, WP/SRC would propose January 2006 as implementation date.

Annex 1: TB for UR Z10.1(Rev.12, C49 amendments, see Permsec's note 1 below)
Annex 2: WP/SRC Task 114, verification and signature of TM reports(see 9 above).
Annex 3**:** TB for revision of UR Zs concerning "anodes".

Note by the Permanent Secretariat

1. Annex 1 to this TB contains background for amendments to UR Z 10.1(Rev.12) relating to FAIR/POOR/GOOD (C49 amendments). Council at its 49th meeting (June 2004) agreed/decided that comparable changes should be added to Z10.3 and Z10.4.

2. Appendix 3 "TM sampling method" has been added to UR Z10.1 and Z10.4 to keep them consistent with IMO Res.MSC.144(77). The amendments to A.744 contained in MSC.144(77) entered into force on 1 January 2005. *(GPG s/n 4181)*

Under s/n 4072g, paragraph **2.4.6** of UR Z10.1 and **2.4.6** and of UR Z10.4 (paragraph numbering is now harmonized) were amended in order to provide a link between the main text of the UR Z10.1 and 10.4 and the new Annex III Appendix 3 containing the MSC Res.144(77).
Further, it was agreed that the requirements for evaluation of longitudinal strength of the hull girder (as written in MSC.144(77)) should not be required for Intermediate Survey unless deemed necessary by the attending Surveyor. This is covered in 4.2.3.1 and 4.2.4.1 of Z10.1 and Z10.4.

3. GPG agreed that the amended UR Zs should be implemented from 1 July 2006 altogether.

4. DNV's proposed amendments to UR Z10.1, Z10.3 and Z10.4 concerning annual survey of ballast tanks were agreed by Council (1060gICq, 27 June 2005). See Appendix 2 to Annex 1.

5. Annex 3 contains a TB for revision of UR Zs concerning "anodes".

Date: September 2004
Prepared by the WP/SRC

– – –

Annex 1 to Technical Background
UR Z 10.1 (Rev.12, C49 amendments(coating-related))

1. Objective

To introduce significant improvements in the survey regime for ballast tanks (including combined/ballast tanks) of oil tankers as matter of strategic concern and urgency to IACS, given the aging of both the single and double hull tanker fleets and the problems encountered with corrosion of ballast tanks in several shipping casualties.

2. Background

Draft amendments to UR Z10.1 were submitted to Council 47 (June 2003) and agreed in principle.

3. Discussion

There was particular concern over accelerated corrosion with age (as the thinner the material, the more rapidly the allowable diminution margin percentage disappears) especially where coatings have broken down. There is also a disincentive for any spend on maintenance of the structure of a ship within a few years of its statutory scrapping date.

Council discussion by correspondence had evolved to the position of substantive proposals – summed as follows (3095_ABa, 2 June 2003):

1. Enhance the Intermediate Survey in Z10.1, Z10.3 and 10.4 for Tankers after 2nd Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey). This corresponds to the latest revision to UR Z10.2.
2. At Annual Survey of ballast tanks with substantial corrosion, the overall survey is to be replaced by close-up survey with thickness measurements of the exposed area.
3. Proposed to task WP/SRC to re-consider the acceptance criteria for the rating FAIR further. For this, eliminate FAIR, leaving only GOOD and POOR redefined as appropriate.
4. Proposed to task WP/SRC to explicitly require close-up survey of Suspect Areas identified at the previous Special Survey.

Council 47 discussed the proposals(June 2003) as follows:

1. Definition of FAIR
   Council 47 agreed that “FAIR” would be retained as a rating and that GPG should instruct WP/SRC to redefine FAIR, so that there would be a clear differences between FAIR, POOR and GOOD. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have the same scope as Special Survey No.2(Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

   Based on the strong majority, Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

   > *DNV and NK stated that they could not accept a requirement for annual surveys of ballast tanks when the coating condition is less*

than GOOD and proposed that GOOD be changed to FAIR (3095_IGc, 30 June 2003)

2. ABS' proposed amendments to Z10.1(annual examination of BWTs in certain conditions) were approved.
3. C 47 agreed that the BWT coating requirements (Z10.1.2.2.3) for intermediate Survey after SS 2 should be the same extent to the previous SS.
4. Given the substance of the changes, the revised Z10.1 should be shown to Industry before adoption.
5. A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.

Following Council 47, the draft text of Z10.1(Rev.12) was distributed to Industry and discussed at the IACS/Industry meeting on 29 August 2003. Industry indicated that UR Z10.1(Rev.12) is acceptable, provided that appropriate IACS guidelines on coating repairs are developed.

The Small Group on Coating (SG/Coating) under WP/SRC prepared draft guidelines on coating repairs and considered the definitions of GOOD / FAIR / POOR. The SG/Coating did not change the definitions and found that the Guidelines provide useful clarifications on the definitions and criteria in achieving an industry wide uniform judgement of coating conditions as well as what is needed to restore GOOD conditions.
Further, an IACS/Industry JWG/Corrosion was established and met in February 2004. The outcome is (3095_IGh, 4 June 2004):

- Draft Guidelines on Coating Repair (IACS REC 87)
- Draft UR Zxx (mandatory coating of cargo tanks on oil tankers)
- Draft UI SC 122 (Rev.2) – mandatory coating of ballast tanks

4. Others

1. Z10.11.2.2bis - Definition of "Combined Cargo/Ballast Tank. …as a routine part of the vessel's operation and will be treated as a Ballast Tank. ...". By so amending, Z10s do not need to repeat "Ballast Tanks *and Combined cargo/salt water Ballast Tanks*" in addressing the ballast tanks. Hence, all the references to "*and Combined cargo/salt water Ballast Tanks"* were deleted.
2. Z10.1.2.2.1.2: The aim of the examination is ~~to be sufficient~~ to discover substantial corrosion…
   Comparable changes are to be added to other UR Zs wherever the same sentence occurs.
3. "IACS Guidelines for Coating Maintenance & Repairs for Ballast Tanks and Combined/Ballast tanks on Oil Tankers" are referenced where relevant.
4. Comparable changes are to be added to UR Z10.3 and Z10.4, after adoption of Z10.1(Rev.12).

Attached: Memo on Coating Matters (GPG Chairman)

9 June 2004
Prepared by the Permsec

Appendix 1 to Annex 1: MEMO on Coating matters

1. Background and discussion within IACS on UR Z10.1 (draft Rev.12) between 29/01/03 and 14/08/03

In view of the survey experience with oil tankers, it was proposed that all ballast tanks should be examined, routinely and uniformly, at annual surveys on ESP tankers exceeding 15 years of age. IACS should amend UR Z10.1 to require the examination of ballast tanks on such ships at each annual survey. This is simple, clear and thorough and not subject to interpretation. (2242_ABq dated 29/1/03)

Then, ABS modified the proposal asking, for tankers subject to URs Z10.1, Z10.3 and Z10.4, exceeding 15 years of age, that the current requirement - pertaining to annual examination of Ballast Tanks adjacent to cargo tanks with any means of heating - be deleted and replaced by a simpler and more stringent requirement that all Ballast Tanks be subject to survey at each subsequent annual survey where either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and the protective coating is not renewed at special survey or intermediate survey. This will ensure that all Ballast Tanks with substantial corrosion or protective coating which is not in GOOD condition at the time of special survey or intermediate survey will be examined at each subsequent annual survey on tankers exceeding 15 years of age. (2242_ABzb dated 14/3/03)
This was later expanded to include all tanks used routinely for ballast water, both ballast-only and cargo/ballast tanks (2242_ABzc dated 14/3/03).

ABS further reviewed the issue of the survey of salt water ballast spaces and combined cargo/salt water ballast spaces with ABS' governing bodies in light of recent casualties and survey findings on other tankers. Their review found an increasing amount of coating breakdown/failure and subsequent rapid wastage in key structures after Special Survey No. 2, i.e. after 10 years of age. These conditions are most prevalent in the under deck structure and the side shell structure in way of the deep loadline. In a number of cases the serious wastage has caused fracturing of the under deck longitudinals and in some cases fracturing has extended to the main deck structure. This led ABS to refine proposed amendments to URs Z10.1, Z10.3 and Z10.4 to require (2242_ABzf dated 9/5/03):

a. For Tankers exceeding 10 years of age

> Salt Water Ballast Spaces and Combined Cargo/Salt Water Ballast Spaces. For tankers exceeding 10 years of age, salt water ballast spaces and combined cargo/salt water ballast spaces are to be internally examined at each subsequent Annual Survey where substantial corrosion is found within the tank or where the protective coating is found to be less than GOOD condition and protective coating is not repaired. Internal examination to be an Overall Survey.

b. For Tankers exceeding 15 years of age:

Salt Water Ballast Spaces and Combined Cargo/Ballast Spaces. For tankers exceeding 15 years of age, salt water ballast spaces and combined cargo/ballast spaces are to be examined internally at each subsequent Annual Survey. Where substantial corrosion is found within the tank, or where the protective coating is found to be in less than GOOD condition and the protective coating is not repaired then in addition to an Overall Survey, under deck structure and the side shell structure in way of the deep loadline is to be subject to Close-up Survey.

NK and BV replied that the proposed amendments made by ABS need to be substantiated in a transparent manner with technical data that ABS may possess and put forward for further assessment and discussion. (2242_NKn dated 14/5/03 and 2242_BVz dated 16/5/03)

DNV (2242_NVn dated 2/6/03), having carefully considered the practical consequences of taking the ship off-hire for gas freeing etc. and being concerned about the difficulties to have these surveys executed in a safe manner and whether the intended safety benefits in implementing the proposed extended scope of the annual survey of Ballast tanks will be met, **proposed the following alternative measures** which would be as effective and may not have such delaying effects to the ship:

1) Enhance the Intermediate Survey in UR Z10.1, 10.3, and 10.4 for Tankers after the 2 Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey. (This will correspond to the latest revised requirements of UR Z10.2 for Bulk Carriers.)
2) At Annual Survey of ballast tanks with substantial corrosion the overall survey should be replaced by close up survey with thickness measurements of the exposed area. (An overall survey of these tanks does not give sufficient information of the development of the areas with substantial corrosion.)
3) Further we will not fail to mention that the WP/SRC has proposed to extend the close up survey in cargo and combination tanks to 30% from the 3 Special / Renewal Surveys.
4) **Experience has shown that the coating condition rating category FAIR has a tendency to be stretched too far into the POOR condition. We will therefore propose that we task the WP/SRC to reconsider the acceptance criteria for the rating FAIR further.**
5) We do also question the need for redefining the definition of combination tanks, particularly since the category I tankers which are the ships that normally are fitted with these type of tanks are to be phased out 2 to 4 years from now. However DNV will not oppose to such a redefinition.

DNV requested Members to consider the above as an alternative to the ABS proposal, bearing in mind that we ought to present this to the industry prior to deciding.

ABS (3095_Aba dated 2/6/03), having further considered its earlier proposals in light of NVn, submitted a revised proposal for consideration by Council at C47 and replied to the above 5 DNV proposals as follows:

1) ABS fully supports this proposal.
2) While ABS agrees with this proposal, it is in fact already provided for in Z7 (3.2.3) and Z10.1 (3.2.5.1)--which require that "Suspect areas (which include any area where substantial corrosion is found) identified at previous Special Survey are to be examined. Areas of substantial corrosion identified at previous special or intermediate survey are to have thickness measurements taken." To us, this implies that close-up survey of these areas is to be done at annual survey in conjunction with the thickness measurements. However, we can

agree to tasking WP/SRC to explicitly require "close-up" survey in this connection and to amend Z7, and all the Z10's, appropriately to make this explicit, if there is majority support for this.

3) We agree that this has been put forward to GPG by WP/SRC via 0237hNVb, 27 May. However, these additional CAS close-up survey requirements do not apply to salt water ballast tanks; only to cargo oil tanks and combined cargo/ballast tanks.
4) **We agree with this assessment and we propose that the only way to eliminate the subjectivity and raise the standard is to eliminate the category "FAIR" completely; leaving only "GOOD" and "POOR" redefined as follows:**
   "GOOD -- condition with no breakdown or rusting or only minor spot rusting.
   POOR -- any condition which is not GOOD condition."
5) ABS does not agree with this proposal. We are particularly concerned that we need a very thorough and robust survey regime for these tankers precisely because they are subject to mandatory phase out over the next several years. We are very concerned that without additional IACS requirements, these tanks will receive little or no inspection and maintenance by owners or others after their last special or intermediate survey, if no substantial corrosion is found at that time. Rapid, localized wastage in way of deteriorating coatings may pose significant hazard if the survey regime is not further tightened as we are proposing.

In conjunction with the above comments on DNV proposals, ABS further considered their previous proposal in ABzf and modified it as follows:

- **ABS simplified the proposal to require annual examination of all salt water Ballast Tanks and combined Cargo/salt water Ballast Tanks irrespective of age, when either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and is not repaired.**
- the requirement for annual (close-up) examination of salt water ballast tanks and combined tanks is already required in Z10.1 (3.2.5.1). ABS proposed adding it to 2.2.3 for clarity and emphasis so that all the conditions which may lead to annual examination of such tanks are listed together in one place.
- Since the principal problem that we are trying to address is rapid, localized corrosion in way of breakdown or deterioration of the protective coating, we are proposing that the coating condition should be found and kept in "GOOD" condition to obviate the need for annual examination. **The attached proposal is made together with the proposals in items 3.1 (intermediate following Special survey 2 to have same scope as prior Special survey) and 3.4 (eliminating "FAIR" and redefining "POOR" as any condition other than "GOOD" condition.**

ABS requested to decide on a course of action at C47 for tightening the survey regime for tankers. They agreed that industry be informed of Council's decisions in this regard prior to IACS making the decision public, but IACS should maintain its independence and take decisive action in this matter. Debate with industry can only lead to delay and to a watering down and compromising of these important requirements.

NK agreed to task WP/SRC to reconsider the acceptance criteria of "FAIR" for clearly define the border between "FAIR" and "POOR" condition. However, **NK strongly opposed the elimination of "FAIR" coating condition from UR Zs** because this can not resolve to remove subjectivity of coating assessment. The three-categorization system of coating condition should be retained. (3095_NKa dated 5/5/03)

Outcome of C47

At **C47**, it was agreed that “Fair” would be retained as a rating and that GPG should instruct WP/SRC to redefine “Fair”, so that there would be a clear differentiation between “Fair”, “Poor” and “Good”. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have same scope as Special Survey No.2 (Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

Based on strong majority support Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

This matter should be discussed with Industry prior to adoption of any UR by Council.

In a final summary, the Chairman proposed that a constructive dialogue with Industry should take place on the IACS proposal as set out in WP1 plus maintaining 3.2.5.2 modified to say that ballast/combined ballast/cargo tanks will be subject to annual survey when considered necessary by surveyors.

After discussion in the JWG (Industry/IACS), GPG should propose final rules for this matter to Council, including acceptable repair definition.

F**UA 17:** *To instruct WP/SRC to develop guidance on coating repairs and more precise definition of “Fair” coating condition.*

Once approved, these requirements should be incorporated into Z10.3 and Z10.4.

FUA 15

1) *To prepare a draft revision to UR Z10.1 incorporating C 47 decisions:*
   - *The definition of “FAIR” remains as it is;*
   - *ABS proposed amendments to Z10.1 (annual examination of BWTs in certain conditions) were approved;*
   - *C47 agreed that the BWT coating requirements (Z10.1.2.2.3) for Intermediate Survey after Special Survey No.2 should be the same extent to the previous Special Survey.*
   - *Given the substance of the changes, the revised UR Z10.1 should be shown to Industry (OCIMG/Intertanko first among others) before adoption for their review and comments.*
   - *A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.*

2) *GPG Members are to confirm the draft revision to Z10.1 in consultation with their WP/SRC members by correspondence. See 3095_IGa of 13/06/03.*

According to C47 FUA 15, GPG Chairman circulated (3095_IGa dated 13/6/03) draft amendments to UR Z10.1 as agreed in principle at C47.

Having received a number on comments, GPG Chairman (3095_IGb dated 27/6/03) informed that the Council Chairman confirmed that GPG is not to amend the principles agreed at C47, i.e. we are not empowered to change "GOOD" to "FAIR" as proposed by DNV and NK, nor to amend the definitions of "FAIR" and "POOR" as proposed by DNV.

DNV's intention to possibly lodge a reservation was noted, however the matter should be raised at Council and not be dealt with by GPG. An amended draft text incorporating the non-substantive changes proposed by Members was circulated.

DNV said that its understanding was that the draft should be circulated to the Industry (ICS, INTERTANKO, and BIMCO) prior to adoption by Council. (3095_NVc dated 30/6/03)

GPG Chairman (3095_IGc dated 30/6/03) circulated a draft amendment of UR Z10.1 for Council's agreement and use in discussions with the industry associations.
The draft was generally agreed by GPG but individual Members have requested that the following matters (which were deemed to be outside the remit of GPG in this task) be brought to Council's attention for further consideration:

1 DNV and NK stated that they can not accept a requirement for annual surveys of ballast tanks when the coating condition is less than GOOD and propose that GOOD be changed to FAIR.
2 In connection with item 1 above, DNV also propose to amend the definitions of FAIR and POOR in order to raise the standard of FAIR.

Council Chairman (3095_ICb dated 14/8/03) concluded that Council has agreed that the draft amendments to UR Z10.1 attached to IGc reflect Councils' decision taken at C47 and that they be circulated to industry associations.
Perm Sec was therefore invited to submit the draft to OCIMF and INTERTANKO in view of discussion at the IACS/ industry meeting on 29 August.

2. Discussion with Industry (29/08/2003 – 11/10/2003)

As requested by Council, the whole matter was presented to Industry during the "general matters" meeting with IACS held on 29 August 2003; comments from Industry were requested. In the following an extract from the minutes of the meeting (see message 3100aIAb dated 5 September 2003):

___________________________ from Meeting minutes _________________________________

4. & 5. Annual surveys of ballast tanks and IACS guidelines on coating repairs

M. Dogliani introduced the matter (see Items 4&5 in Appendix).

A. LinoCosta gave a presentation to show where concerns and decisions stand: too many cases when coating was considered fair at SS but problems occurred just after one/two years.

N. Mikelis commented on draft amendments to Z10.1 (Rev.11) stating that the extent of annual survey is not clear; it should be limited to the affected zones, e.g. coating breakdowns, only.
M. Guyader clarified that, in this draft amendments, it is expected an overall survey of the whole tank and a close up survey of the affected zones.
N. Mikelis noted that, in the draft amendments to Z10.1 (Rev.11), the intermediate survey at 12.5 years would have the same scope as the previous special survey and that needed a justification. See 7 a).
M. Dogliani said that Z10.1 (Rev.11) was adopted in August 2003 and will be introduced into IACS Societies' Rules over the next year.

Conclusions:
4.1 Industry shared IACS concerns on coatings and, in general, agreed with the draft amendments to Z10.1 (Rev.11) suggesting also extending them to Z10.2 on bulk carriers

4.2 Industry agreed that a guideline for surveyor on coating would greatly improve uniform application of so-amended Z10.1 including issues such as how to consider load bearing elements when judging GOOD/FAIR/POOR status and how to consider bottom pitting in connection with GOOD conditions
4.3 Industry will more precisely comment, by the end of September, the draft Z10.1 so as for IACS to finalise the matter, as planned, for the Council's December meeting.

Item	Title	Industry recommandation	IACS/ M. Dogliani Introduction
4 & 5	Annual survey of ballast tanks IACS guidelines on coating repairs	NN	**1. IACS is considering the following:** - **amend UR Z10.1 (draft circulated to Industry) to the effect that in case at Special Survey or Intermediate Survey the coating in a ballast tank is found less than GOOD, either GOOD conditions are restored or the tank's coating is inspected at each annual survey;** - **develop IACS guideline to assist an uniform application of the so modified (if adopted) UR Z10.1; the guideline should address which repairs are necessary to restore GOOD conditions from FAIR and POOR respectively and which are the criteria for the restored (after repair) situation to be rated as GOOD.**

______________________________ End of extract from minutes ___________________________

INTERTANKO commented (see R. Leslie email to GPG dated 25 September 2003):

- expressing their concern for the draft Z10.1 and underlining

a) targeting: concerns that, if not properly dealt with, Z10.1 would target all ships and not just those which need intervention; the view was expressed that guidelines would probably solve the matter;

b) definition: indicating that the current definitions of GOOD, FAIR and POOR is not clear enough and that the matter would be even worst with GOOD and NON GOOD; again it was indicated that guidelines could solve the matter;

c) expertise: expressing doubts on IACS' surveyors expertise and ability to judge coating conditions; in this respect they (hiddenly) suggest that IACS position is unclear when we say that we are not competent to judge the coating during construction but then we are competent to judge coating during operational life. Even if not explicitly stated, the impression is that also in this case guidelines would help.

Additionaly, INTERTANKO suggested a (quite detailed) set of assessment criteria.

The matter was then finally addressed at the TRIPARTITE Meeting (held in Soul on 29/30 September 2003). There Industry agreed that the way forward was the (joint) development of IACS guidelines (see minutes attached to message 3100_RIe dated 11 October 2003, an extract of which is reproduced below).

______________________________ Extract from the TRIPARTITE minutes ________________

Industry is concerned by the definition of GOOD/NOT GOOD in relation to coating repairs and acceptance criteria. Industry agreed that new guideline on this, which IACS is already producing, was the way forward.

______________________________ End of the extract from the minutes __________________

3. Further developments

a) from the above, it was concluded that, provided the guidelines are sound, Industry would accept the concept of Z10.1 (draft) Rev. 12, therefore an IACS team and a JWG were established in order to progress the matter of the guidelines (among other related matters).

b) the team of IACS experts on coating developed draft guidelines and provided recommendations to GPG on the way forward (attached to message 3095bNVc dated 20 November 2003).

c) the guidelines were discussed within the JWG with Industry (see draft minutes circulated within GPG with messages 3095cIGd and 3095cIGe both dated 13 March 2004)

d) further suggestions and comments (as requested at the meeting) were provided by Industry (not circulated to GPG)

e) Bulk Carrier Industry is recommending that similar guidelines are developed in due time also for bulk carriers

f) at DE47 and MSC78, IMO is asking Industry and IACS to develop (compulsory) performance standards for coating of newbuilding (double hull spaces of DSS Bulk Carriers), a matter which is, indirectly related to the above one.

25 May 2005

To: Mr. B. Anne, Chairman of IACS Council,
cc: Council Members, IACS Perm. Sec.

Ref.: My mail NVr dated 20 May 2005

DNV have further studied the amendments to UR Z10.1, Z10.3, and Z10.4, and as a result are presenting the following as a compromise solution:

General comment:
From the comments by other Members it is obvious that there is reluctance to accept annual surveys of ballast tanks with a common plane boundary to heated cargo tanks in the case where the coating is in good condition. This is particularly unreasonable as at the same time we enhance the Intermediate survey of Tankers between 10 and 15 years to also include examination of all ballast tanks, meaning that all ballast tanks will be close up surveyed with 2-3 years intervals from the ship is 10 years old, with the possibility for the surveyor to require thickness measurements and testing of the tanks to ensure the structural integrity of the tanks if necessary.
It is also proposed for the Intermediate survey between 5 and 10 years, to increas the scope from representative to all ballast tanks, a requirement DNV find to strict, and require that we here keep the original text.
If a ballast tank is found to have coating in GOOD condition at the renewal or intermediate survey, a deterioration of the tank beyond structural reliability is very unlikely even if the tank has a common plane boundary to a heated cargo tank.

DNV finds it particularly unreasonable to have this requirement to apply to double hull tankers for the following reasons:
- these ships have double hull and the risk of pollution is here much reduced,
- the double hull is constructed with small spaces giving improved structural reliability,
- almost all double hull tankers below VLLC have heated cargo tanks, and all ballast tanks have common plane boundaries to these tanks, meaning that this requirement will apply to a major part of the tanker fleet in the future,
- the ballast tanks of double hull tankers are so designed that a general examination of these tanks will be identical to a close up survey,
- survey of ballast tanks of double hull tankers will mean either gas freeing of all cargo tanks or at least dropping the inert gas pressure of all cargo tanks in addition to proper airing of all ballast tanks.

Since the single hull tankers will be faced out in the near future, and for clear political reasons, DNV will as a compromise proposal to keep paragraph 2.2.3.1 and 4.2.2.2 in Z 10.1 as amended by Council (ref. IAo) but amend it to not include 2.2.3.1.e, 4.2.2.2.e and last paragraph of 3.2.5.1 in Z10.3 and Z10.4. In addition we request that the original text of 4.2.2.1 is kept.
If BV, ABS and other Members can accept this DNV is willing to drop our reservation presented at C49.
DNV's proposal will then be as follows:

Z10.1:

2.2.3.1: This paragraph can be accepted as is for the reasons stated above.
3.2.5.1: This paragraph is accepted as amended.
4.2.2.2: This paragraph can be accepted as is for reasons stated above.

For other comments to Z10.1 see NVo and NVp.

Z10.3:

2.2.3.1.e to be deleted.
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept."For tanks used for water ballast ---"
4.2.2.2.e to be deleted

Z10.4

2.2.3.1e to be deleted
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept, "For tanks used for water ballast --"
4.2.2.2.e to be deleted.

For details see attached document where the text for the requirements in Z10.3 and Z10.4 that DNV will accept is stated.

Best Regards

Arve Myklebust

Annex 2 to TB (Harmonization Z10s)

WP/SRC Task 114 "Clarify the procedure of verification and signature of the thickness measurement report"

Item No.	Item	ABS	BV[1]	CCS	CRS	DNV	GL	IRS	KR	LR	NK	RINA	RS
1	**Verification onboard**	.											
1.1	Minimum extent of measuring points for direct verification by attending surveyor specified	No	No	No	No	No	No	No	Yes	No	No	Yes	No
1.2	Preliminary TM record to be signed upon completion of the measurements onboard	Yes	Yes [7]	Yes	No (copy taken)	No[3]	No[6]	Yes	Yes	Yes	Yes	No[8]	No
2	**Final TM report**												
2.1	Signature of all pages in TM record required	No	No	No	Yes	No	Yes	Yes	No	No	No[5]	Yes	Yes
2.2	Signature of 'cover' ('general particulars') page only	Yes	Yes	Yes	No	Yes	No	No	No[4]	Yes	Yes	Yes	No
2.3	Measuring points verified by attending surveyor required identified in TM record and signature of the corresponding pages required	No	No	Yes Without signature	Yes	No	No	No	Yes	No	No	No	No

2004-04-20

[1] Instructions not clear regarding signature of the thickness measurement record

[2] Signature on front and last page, stamp on all other pages, or signature on each page (IACS TM forms)

[3] Upon completion of measurements onboard a draft report in electronic format (DNV TM template, including operator's notes as relevant) to be given to attending surveyor

[4] Signature of cover page, pages of meeting record and pages of attended measuring points

[5] Each page to be signed in case of 'loose-leaf' type record

[6] Preliminary TM record has to be passed to the Surveyor, signed by the Operator

[7] The only measures which the Surveyors can certify exact are those for which that they have seen the results on the screen of the apparatus. That means in fact few points in comparison with the numbers of recorded measures.

[8] The Surveyor reviews the TM record for completeness and assessment of TM readings, but no signature required.

Annex 3: **Technical Background**
(May 2005)

UR Z7s and Z10s (Corrosion Prevention System)

1. Objective:

To clarify whether the survey of anodes is a class matter, and if so, whether acceptance criteria for anode should be developed.

2. Method: GPG by correspondence (5037_)

3. Discussion

3.1 BV initiated GPG discussion as follows:

Paris La Défense, 8 Mars 05

1 - We have noticed that, in the draft UR Z's (7.1, 10.1 to 10.5) issued further to the WP/SRC Task 102, the original sentence "......the examination may be limited to a verification that the hard protective coating remains efficient......" has been replaced by ....that the corrosion prevention system remains efficient....". in a number of paragraphs (such as , for instance, Z 7.1, 4.2.3.1 a) ; Z 10.2 4.2.3.3 ;), in line with IMO Res.A744(18).

2 - However, a corrosion prevention system is defined, in the same UR Z's and in IMO Res.A744(18) , as being either a full hard protective coating or a full hard protective coating supplemented by anodes.

3 - The above would mean that the survey of the anodes is a classification matter.

4 - However, whereas coating conditions are defined as good or fair or poor, there are no criteria in the IACS URs and IMO Res. A744(18) for the anodes condition.

5 - Assessing the anodes condition to confirm that they "remain efficient" looks to BV to be a quite difficult task for the ships in service Surveyor.

6 - Member's view and interpretations on the following would consequently be appreciated:
- do Members consider that the above requirements in IACS URs imply that survey of anodes is part of the classification ?
- do Members consider that the above requirements in IMO Res. A 744 (18) imply that survey of anodes is mandatory?
- if yes, what is the acceptance criteria to conclude that the anodes" remain efficient" ?

3.2 The majority of GPG Members replied that they did not include requirements for anodes in their class rules.

LR / ABS / DNV / KR / NK / RINA / RS were of the view that the condition of any anodes fitted should be recorded for information purposes as the survey of anodes is neither a classification matter nor a mandatory requirement in IMO A.744(18) and has no impact on future surveys (5037_LRa**). [**Note; LR further clarified that “Whilst I agree that the performance of anodes is not normally a class matter LR does require that as part of Special Survey on oil tankers : "The attachment to the structure and condition of anodes in tanks are to be examined ." Therefore we cannot say that 'the survey of anodes is not a classification matter'**. 5037_LRb]**

However, GL said that “for GL, anodes are a matter of class and as such are subject to plan approval as well as surveys. In case of missing or worn-out anodes we issue a condition of class”(5037_GLa&b).

CCS advised that its rules have a general requirement relating to anode survey, which is only conducted, through sampling, during construction, docking survey or where there is a definite requirement for the survey of ballast tanks.

NK proposed that the following footnote be added to Z7s and Z10s:
“The survey of anodes is not a classification matter.” No majority support was achieved.

4. Conclusion

RINA suggested to simply amend the definition of "Corrosion Prevention System" in paragraph 1.2.9 of UR Z7 (and, of course, the paragraphs in all the other UR Zs containing the definition of "Corrosion Prevention System") in order to eliminate any reference to anodes. This proposal would leave room for Societies willing to include additional class requirements for anodes to do so in their Rules.

GPG agreed.

RINA proposed amendments to paragraph 1.2.9 of UR Z7 and corresponding paragraphs in all other UR Zs (5037_RIb, 6 April 2005)

1.2.9 Corrosion Prevention System

A corrosion prevention system is normally considered ~~either:~~ a full hard protective coating.
~~.1 a full hard protective coating, or~~
~~.2 a full hard protective coating supplemented by anodes.~~
Hard protective coating is usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer’s specifications.
Where soft coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

Annex: Council Chair’s conclusive message.

6 May 2005
Permsec

Annex. (5037_ICb, 15 May 2005)

To : All IACS Council Members
c.c : Mr. R. Leslie, IACS Permanent Secretariat

Ref. Mr G-Y. Han's message IAa dated 6 May 05
Message ICa dated 6 May 05
Admiral R.E. Kramek's message ABb dated 13 May 05

Paris La Défense, 15 May 05

1 - All Members have agreed with the texts attached to Mr Han's message.

2 - Further to ABS comments the reference to anodes is to be deleted in Annex I and in tables IX (IV) and IX(II).

3 - further to ABS questions regarding what IACS plan to do regarding IMO and A.744(18) further to IACS deletion of reference to anodes from the UR Z7's and UR Z10's it is to noted that:

The Item 1.2.9 in UR Z1O.1 and relative items in these URs states
1.2.9 10 Corrosion Prevention System: A corrosion prevention system is normally considered either:
.1 a full hard protective coating, or
.2 a full hard protective coating supplemented by anodes.
Hard Pprotective Ccoating is to usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specification.
Where Soft Coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

- therefore the anodes are not considered as the main means of protection against the corrosion It is only a supplement;

- there is no provision in UR Z7's and Z10's to evaluate the level efficiency of the anodes;

- there is no specific requirements in case of lack of efficiency of the anodes.

The experience has shown that ballast tanks only protected by anodes are subject to corrosion when the anodes are becoming less efficient.

The anodes are active only when immersed by sea water. Therefore the upper part of the ballast tanks are not protected when the ballast is full of water and the ballast is not protected when it is empty..

The ships operators are reluctant to replace the anodes especially in upper part which request fitting of scaffolding fo welding the anode supports to the structure.

The above arguments justify the reasons why IACS consider that the anodes are not class item.

4 - These arguments can be used by IACS Members attending the WG bulk carriers at MSC 80 to try to obtain deletion of the reference to anodes in A. 744(18).

Best regards,

Bernard Anne
IACS Council Chairman.

Technical Background

UR Z10.1(Rev.13, Jan 2006)
UR Z10.2(Rev.18, Jan 2006)-separate TB
UR Z10.3(Rev.8, Jan 2006)
UR Z10.4(Rev.3, Jan 2006)
UR Z10.5(Rev.2, Jan 2006)

Part 1. Z10s – para. 1.4 and 7.1.3

Part 2. Z10s – para. 5.5.4 and 5.5.6

Survey Panel Task 22 – Amend applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

Technical Background

Z7(Rev.12)
Z7.1(Rev.3)
Z10.1(Rev.13, para.1.4 & 7.1.3)
Z10.2(Rev.18, para. 1.4 & 7.1.3)
Z10.3(Rev.8, para. 1.4 & 7.1.3)
Z10.4(Rev.3, para. 1.4 & 7.1.3)
Z10.5(Rev.2, para. 1.4 & 7.1.3)

1. **Objective**

To amend the applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

2. **Background**

IACS QC findings, through audits of numerous Societies, which indicated concerns over Surveyor attendance and control of thickness measurement processes.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

To align Close-up survey requirements and thickness measurements in the applicable URZ7s and URZ10s, in accordance with PR19, all Panel members agreed through correspondence and a final vote at the fall Survey Panel meeting, that URZ7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 should include in the applicable sections of the noted URs as proposed by the Survey Panel the wording " In any kind of survey, i.e. special, intermediate, annual, or other surveys having the scope of the foregoing ones, thickness measurements of structures in areas where close-up surveys are required, shall be carried out simultaneously with close-ups surveys."

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Technical Background

UI SC 191 (Rev.2, Oct 2005)

&

UR Z10.1 (Rev.13, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.2 (Rev.18, para. 5.5.4 and 5.5.6, Jan 2006)
UR Z10.3 (Rev.8, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.4 (Rev.3, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.5 (Rev.2, para.5.5.4 and 5.5.6, Jan 2006)

1. Objective

- to confirm whether the guidelines for approval/acceptance of alternative means of access (now REC91, ex Annex to UI SC191) is mandatory or non-mandatory.
- to consider other safety related proposals.

2. Background

The DNV proposal to submit the UI SC191(Rev.1, May 2005, Annex 1) to IMO DE49 triggered a number of discussion points that led to amendments to the following resolutions:

UI SC191(Rev.2)
New REC 91
REC 39(Rev.2)
UR Z10s

Points of Discussion

3. Is the Annex to UI SC191(Rev.1, May '05, guidelines for approval / acceptance of alternative means of access) mandatory or non-mandatory ?

   Answer: Non-mandatory. Hence, re-categorized as new REC 91.

4. Limitation of use of rafts in bulk carrier holds

   DNV proposed that conditions for rafting should be limited to areas, such as anchorage or harbour, where swell conditions are limited to 0.5m. After discussion, GPG approved the ABS' alternative proposal to use the swell condition as a basis to determine the appropriateness of rafting, instead of geographic areas(harbours or anchorage). 5.5.4 of Z10.2 refers.

RINa proposed that para 5.5.4 should be included in all the Z10s. NK's objection is recorded as follows (3037hNKq, 29/08/2005):

> 1. With regard to RIm of 26 August 2005, NK considers that the proposed amendment to 5.5.4 should be limited to UR Z10.2.
>
> 2. Rafting survey for tankers are actually carried out on the open sea from a discharge port to a loading port and in such situation the rise of water within the tanks would always exceed 0.25m. It is different situation from rafting survey for hold frames of bulk carriers normally conducted in a harbour or at an anchorage.
>
> 3. If the same requirement applies to tankers, any rafting survey for cargo oil tanks and ballast tanks of tankers would be prohibited. This is not practicable under present survey procedure for tankers.
>
> 4. Therefore, NK can not support Laura's proposal that the proposed amendment to 5.5.4 of UR Z10.2 is introduced into the other URs and new Recommendation.

For compatibility with the IMO's mandatory requirements*, GPG decided to add the same amendment to all the UR Z10s.

*

- Appendix 4 to MEPC.99(48) ' Mandatory requirements for the Safe Conduct of CAS Surveys'
- MSC.197(80) – amendments to A.744918), Annex A for DSS and SSS bulk carriers and Annex B for single and double hull oil tankers.

As a consequence, 5.5.1 of REC 91(ex Annex to UI SC191) was also amended:

-to remove the reference to dynamic /sloshing (as the 0.25m rise was considered negligible);

-to refer to the rafting conditions contained for cargo holds in Z10.2 and Z10.5 and for oil cargo tanks in Z10.1 and Z10.4.

5. Means of access from longitudinal permanent means of access within each bay to rafts

GPG reviewed the proposal that the following text be added to Z10s:

A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay.

(Technical Background: for the safety of surveyors)

There may be ships which are arranged in accordance with para b, page 8 of the Annex to the current SC 191 (i.e., no means of access from the LPMA in each bay to a raft is required) and therefore could not be rafted if the sentence proposed by RINA("A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay") is included in the Z10's.
GPG therefore agreed not to include this sentence in Z10s.

For the same reason, the same sentence was not added to Rec.39.

Finally, GPG added the following sentence to UI SC191(interpretation for II-1/3-6):

> *A permanent means of access from the longitudinal platform to the water level indicated above is to be fitted in each bay (e.g permanent rungs on one of the deck webs inboard of the longitudinal permanent platform).*

6. Implementation

It was agreed that the revised UI SC191 be implemented to ships contracted for construction 6 months after adoption by Council.

UI SC191 was also edited in line with IMO MSC/Circular. 1176, leaving its mandatory language (is/are to, shall) unchanged.

(Note: UI SC191(Rev.2) makes references to the following new Recommendations:
- REC 90: Ship Structure Access Manual
- REC 91: Guidelines for approval/acceptance of Alternative Means of Access)

23 September 2005
Permanent Secretariat
Updated on 13 Oct 2005.

Technical Background

URs Z7(Rev.15), Z7.1(Rev.5), Z7.2(Rev.1), Z10.1(Rev.15), Z10.2(Rev.26), Z10.3(Rev. 9), Z10.4(Rev.6), Z10.5(Rev.8) – November 2007

Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions

1. Objective

To review IACS Resolutions annually and discuss or propose amendments as deemed necessary.

2. Background

This proposed amendment to all URZ7s and URZ 10s was raised by the Panel member from DNV due to Owners crediting tanks concurrently under intermediate and special survey.

3. Methodology of Work

Survey Panel members through correspondence.

4. Discussion

The Panel member from DNV raised the issue of Owners having the ability of crediting spaces and thickness measurements only once in a 54 month interval, due to the availability of concurrent crediting of spaces and thickness measurements due to the flexible time window that is currently allowed between the intermediate survey and the special survey.
After a presentation and discussion lead by the DNV Panel member, all Survey Panel members agreed to the argument given by DNV, and further agreed to make the necessary changes in all URZ7s and URZ10s where Owners are not allowed to concurrently credit surveys and thickness measurements of spaces.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG approve to the amendments, the Survey Panel would propose January 2009 as an implementation date.

Submitted by Survey Panel Chairman
22 October 2007

Permanent Secretariat note (December 2007):

During GPG discussion DNV proposed that *“since this matter will be discussed between Owner and Class mainly in connection with the forthcoming Special Survey, DNV would prefer to locate this text, not only as part of Intermediate Survey, but also as a new text for the Special Survey.”* This was supported by BV, ABS, RINA and KR.

The revised documents were approved, with DNV’s proposal and an implementation date of 1 January 2009, on 15 November 2007 (ref. 7690_IGb).

Technical Background Document

UR Z10.3 (Rev.10 Dec 2008)

Survey Panel Task 55: *Harmonization of UR Z10.3 – Requirements for Chemical Tankers to UR Z10.4 – Requirements for Double Hull Oil Tankers, as they both follow the ESP requirements for ESP Tankers*

1. Objective

Amend UR Z10.3 – Requirements for Chemical Tankers with a view to harmonizing to UR Z10.4 – Requirements for Double Hull oil Tankers, taking into account that both URs follow ESP requirements for ESP tankers.

2. Background

The task was triggered by the DNV Member, at the September 2007 Survey Panel meeting, on the grounds that UR Z10.3, which deals with survey requirements for chemical tankers, is not harmonized with UR Z10.4, which deals with survey requirements for double hull oil tankers, while the two types of ships often have identical structural arrangements.

DNV's initial proposal was to merge the two URs into a single UR, but after discussion within the Panel (by correspondence and at the March 2008 Survey Panel meeting) the decision was made to retain the two URs separate. The task was performed by setting up a Project Team, with members from RINA, acting as PT Manager, BV, CCS, DNV and GL.

3. Discussion

The Member from DNV, who had triggered the task, prepared a first partial draft highlighting the differences between the two URs. The PT Manager developed the first draft completing the comparison between the two URs.

The Project Team held one-day meeting in June 2008, during which a final draft was prepared, which, after further discussion by correspondence among the PT Members, was submitted to all Survey Panel Members for comments / agreement with the view to finalizing the task at the September 2008 Survey Panel meeting. At that meeting, the task could not be finalized and it was decided that Members would review the draft once more and provide their comments in due course by correspondence.
The task was then finalized on 24 October 2008 upon unanimous agreement from all the Survey Panel Members.

The harmonization process has mainly consisted in introducing in UR Z10.3 those requirements of UR Z10.4 that had been adopted for all the other UR Z10s, except for UR Z10.3 as they had come from IMO Resolution A.744(18).

An important amendment has been made to "TABLE I - MINIMUM REQUIREMENTS FOR CLOSE-UP SURVEY AT SPECIAL SURVEY OF CHEMICAL TANKERS", where different survey requirements have been introduced for chemical tankers of single hull construction and double hull construction. Also "TABLE IV - Requirements for extent of Thickness Measurements at those areas of substantial corrosion - Special Survey of Chemical

tankers within the Cargo Area Length", which is composed of four sheets, has been amended in accordance with the aforementioned differences between single and double hull chemical tankers.
Another notable change has been introduced in the "ANNEX II - Recommended Procedures for Thickness Measurements of Chemical Tankers" which, however, is only recommendatory and not mandatory, where the existing thickness measurements forms have been suppressed and reference has been made to ANNEX II of URZ10.1 for Single Hull Chemical and to Annex II of URZ10.4 for Double Hull Chemical Tankers.

4. Implementation

The Survey Panel is of the view that the implementation date for the revision 10 of UR Z10.3 should be after 12 months from the adoption date by GPG and Council. Therefore the implementation sentence (Note 9 of the UR) should read "Changes introduced in Rev.10 are to be uniformly applied by IACS Societies for surveys commenced on or after the *[one year after the adoption by GPG/Council]*".

Submitted by Survey Panel Chairman
12 November 2008

Permanent Secretariat note (December 2008):
Rev.10 of UR Z10.3 was approved by GPG on 2 December 2008 (ref. 7718aIGb) with an implementation date of 1 January 2010

Technical Background

URs Z7(Rev.16), Z7.1(Rev.6), Z7.2(Rev.2), Z10.1(Rev.16), Z10.2(Rev.27), Z10.3(Rev.11), Z10.4(Rev.7) and Z10.5(Rev.9) - March 2009

Survey Panel Task 62:

A) Harmonization of UR Z10.1, Z10.2, Z10.4 and Z10.5 with UR Z10.3 with respect to items 5.5.4.4 and 5.6.2.

B) Harmonization of UR Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 with UR Z7.2 with respect to the definition of the corrosion prevention system and with respect to the footnote 1 related to semi-hard coatings.

C) Harmonization of the definition of Ballast Tank in UR Z7(Rev.14)

1. Objective

A) Amend the texts of items 5.5.4.4 and 5.6.2 in Unified Requirements Z10.1, Z10.2, Z10.4 and Z10.5 in order to align them with those in UR Z10.3, in which they were changed while performing Task 55, whereas in the other UR Z10s they were kept unchanged on the grounds that this change was out of the scope of Task 55.

B) Amend the definition of "Corrosion Prevention System" and include a Footnote 1 related to semi-hard coatings in Unified Requirements Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 in order to align them with those adopted in UR Z7.2, when this new UR was issued.

C) Amend UR Z7 (Rev. 14) in all items where the term "Ballast Tank" is used in order to get them harmonized with the definition itself.

2. Background

The task, as regards item A), was triggered by a Member Society, while performing Task 55, on the grounds that this part was out of the scope of the task and then should have been dealt with in a separate task.
The task, as regards item B), was triggered as a consequence of the "New Business action item 2" of the Minutes of the September 2008 Survey Panel meting, for sake of harmonization of the various URZs.
The task, as regards item C), was triggered as a consequence of the "Task 54-Examination of Double Bottom Ballast Tanks at annual surveys" of the Minutes of March 2008 Survey Panel meeting, for sake of harmonization of the definition of Ballast Tank in UR Z7(Rev.14).

3. Discussion

The task was carried out by correspondence. All the amended texts for the affected URs were prepared by the Survey Panel Member who had chaired the PT on Task 55, in accordance with the Form A approved by GPG. In addition to the objectives outlined in the Form A, an amendment was added to item 1.3.1 of UR Z10.2 and UR Z10.5 in which the reference 3.2.3.6 in the last item of the list was replaced by 3.2.3.10 as can be correctly verified in the text.
The amended URs were circulated to all Survey Panel Members for review, comments and agreement. The texts of the URs were unanimously agreed by all Members.

4. Implementation

The Survey Panel is of the view that the Member Societies need at least 12 months from the adoption date to implement these amendments into their class rules/procedures. Therefore, in the first version of all amended URs the following implementation sentence should be proposed:

Changes introduced in Rev .xx are to be uniformly applied by Member Societies and Associates for surveys commenced on or after [not less than 12 months after the adoption by GPG/Council].

Since it is common practice and convenience to have implementation dates either on 1st January or on 1st July of the year, the Survey Panel proposes the 1st July 2010 as implementation date, if GPG/Council approve the URs not later than 30 June 2009.

Submitted by Survey Panel Chairman
28 February 2009

Permanent Secretariat notes (April 2009):

1. The amended URs were approved by GPG on 18 March 2009 (ref. 7718bIGd).
2. During the typesetting process it was noted that para 5.1.5 of UR 7.2 was inconsistent with the amended URs and so following consultation with the Survey Panel this was also amended at this time.
3. Regarding the implementation date, GPG agreed to use 1st July 2010 provided that it was consistently used for the amended URs.

Technical Background for UR Z10.3 Rev.12 (Mar 2011)

1. Scope and objectives

1) To amend UR Z10.3 Table I to include references on zones of ship's structures subject to close-up survey according to URZ10.4.

2) To amend UR Z10.3 to harmonize the definition of transverse section.

3) Update of references in the Executive Hull Summary Table IX.

2. Engineering background for technical basis and rationale

1) Assignment of zones subject to close-up survey in URZ10.1 and UR10.4 is different. Chemical tankers may be of single hull as well as double hull construction.

2) Based on that fact that bulk carriers and oil tankers have a transverse framing system applied for example on ship's sides etc. and that UR Z7 is applied to all types of ships and includes an extended definition of transverse section it is necessary to unify this definition in UR Z10s.

3) Update of references in the Executive Hull Summary Table IX such that the introduction of extended annual surveys is noted in the 'Memoranda' section rather than under 'Conditions of Class'.

3. Source/derivation of the proposed IACS Resolution

IACS UR Z10.1 and Z10.4 for item 1) and UR Z7 for item 2).

4. Summary of Changes intended for the revised Resolution:

1) In Table I references to figures of areas (1) to (7) illustrated in URZ10.4 are added to be used for chemical tankers of double hull construction and references to figures of areas (A) to (D) illustrated in URZ10.1 are added to be used for chemical tankers of single hull construction.

2) The following additional text is added to the definition of transverse section in para 1.2.5:

"For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections."

3) In the Executive Hull Summary Table IX (iv) the reference to part H) is updated to part I) as per Table IX (ii).

5. Points of discussions or possible discussions

None.

6. Attachments if any

None.

Technical Background for UR Z10.3 Rev.13, July 2011

1. Scope and objectives

Review the requirement for repairs within IACS UR 7 and UR 10 series, in particular the requirement for Prompt and Thorough Repair, with a view to developing wording that would permit a temporary repair and the imposition of a Recommendation/ Condition of Class under specific and controlled circumstances, and in accordance with PR35.

2. Engineering background for technical basis and rationale

There are instances, for example a localised, isolated and very minor hole in a cross-deck strip, at which a suitable temporary repair, for example by welding or doubling, and the imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date, are considered very adequate methodology for dealing with the defect.

Current IACS Requirements in the UR Z7 and Z10 series, for Prompt and Thorough repair, would not permit this to be an option, the defect would have to be permanently Promptly and Thoroughly repaired, which might require removing cargo, moving to a repair berth and staging inner spaces.

Under the Requirements of IACS Procedural Requirement PR 35 the methodology of Temporary Repair and imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date is fully permissible.

3. Source / derivation of the proposed IACS Resolution

Based upon discussion within the IACS Survey Panel.

4. Summary of Changes intended for the revised Resolution:

Following the definition of Prompt and Thorough Repair in the Unified Requirement, a new paragraph is proposed to be added:-

"1.3.3 Where the damage found on structure mentioned in Para. 1.3.1 is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the surveyor to allow an appropriate temporary repair to restore watertight or weather tight integrity and impose a Recommendation/Condition of Class in accordance with IACS PR 35, with a specific time limit."

Also, Table I was split to into 2 tables for enhanced clarity, Table I.1 for Single Skin and Table I.2 for Double skin ships and miscellaneous editorial errors in the Table I.1 and I.2 are corrected.

5. Points of discussions or possible discussions

a) The points of discussion are as indicated in Sections 2 and 4 above.

b) Discussion took place on whether to prepare this amendment as a Unified Interpretation of IMO Resolution A.744(18)/UR Z7 and Z10 series, finally it was agreed to make direct amendment to the relevant URs.
c) It is proposed that this amendment be submitted directly to the IMO DE/MSC Committees for consideration of amending directly IMO Res. A744(18)

6. Attachments if any

None

Technical Background for UR Z10.3 Rev.16 Jan 2014

1. Scope and objectives

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.
b) To align the requirements in PR37 and UR Z10s regarding safe entry to confined spaces.

2. Engineering background for technical basis and rationale

a) As per the IMO Res. A1053 (27), lengthy conversions (not necessarily of major character) or other major repair work can be assigned for a 5 year period from the date of completion of conversion/repairs/surveys.
b) Safety requirements in IACS PR37 can be applied to carry out survey in safe way for all kind of ships. When there are no indications about the safety of surveyor in UR Z10s then the requirements in PR37 shall be applied.

3. Source / derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

a) Following additional text was included to section 2.1.3 to clarify the class period for lengthy conversions

"In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date."

b) Existing Section 5.2.6 and 5.2.7 were deleted from UR Z10s since provisions of these sections were covered by PR37. Reference of PR37 was included in Section 5.2.1.1.

5. Points of discussions or possible discussions

i) Additional text to Para.2.1.3 was discussed in order to clarify class period.
ii) Panel considered that safety of surveyors should be dealt by PR37.

6. Attachments if any

None

UR Z10.4 “Hull Surveys of Double Hull Oil Tankers”

Summary

This revision is to harmonize the revised requirements in line with the amendments made to ESP Code vide Res.MSC.525(106)

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Rev.18 (Feb 2023)	08 Feb 2023	1 July 2024

New (Dec. 2001)	14 December 2001	

**** Notes:***

1. *Changes introduced in Rev.5 are to be uniformly implemented for surveys commenced on or after 1 January 2008, whereas statutory requirements of IMO Res. MSC 197(80) apply on 1 January 2007.*

2. *The changes to section 6 introduced in Rev.11 are to be uniformly applied by IACS Societies for surveys commenced on or after 1 July 2016. The other changes introduced in Rev.11 are to be uniformly applied by IACS Societies for surveys commenced on or after 1 July 2014.*

- **Rev.18 (Feb 2023)**

.1 Origin of Change:

- o Suggestion by an IACS member
- o Based on IMO Regulation

.2 Main Reason for Change:

To revise the definition of Oil Tanker to exclude ships carrying oil in independent tanks not part of the ship's hull such as asphalt carriers in line with the amendments made to ESP Code vide Res.MSC.525(106).

To refine the wording of tank testing requirements in line with the amendments made to ESP Code vide Res.MSC.525(106).

To refine the wording of ballast tanks examination requirements at annual surveys in line with the amendments made to ESP Code vide Res.MSC.525(106).

To delete a reference, IACS UR Z10.1, in line with other IACS URs and the amendments made to ESP Code vide Res.MSC.525(106).

.3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

.4 History of Decisions Made:

- One survey panel member raised a question whether oil tankers having independent tanks like asphalt carriers are applicable to the ESP Code because the current definition of oil tankers includes those tankers. Survey panel unanimously agreed to the view that those ships carrying oil in independent tanks not part of the ship's hull such as asphalt carriers are not subject to the ESP Code and decided to modify the definition in UR 10s and the ESP Code. It was accepted in SDC8 and published as Res.MSC.525(106). (PSU19047)

- One survey panel member proposed to accept tank testing carried out by crew under the direction of the Master like oil tankers and decided to insert the requirements for oil tankers after minor modification of wording. However, at SDC8, the proposal for bulk carriers was rejected but the minor modification of wording for oil tankers was accepted. Survey panel considered to resubmit this issue to next SDC but decided not to do because it was disagreed by Ship owners/operators associations like INTERCARGO and ICS. (PSU17030/17039)

- One survey panel member suggested to refine the wording ‘extended annual/intermediate survey’ to ‘examination of ballast tanks at annual surveys’ in Executive Hull Summary and panel decided to modify it in the ESP Code first. It was submitted to SDC8 and included in Res.MSC.525(106). (PSU18056)

- One survey panel member pointed out that the references in UR Z10s need to be deleted to be in line with other UR Z10s. And panel decided to delete the reference of itself in UR Z10.1 in line with the amendments made to ESP Code vide Res.MSC.525(106). (PSU19057)

No TB is expected for the present revision.

.5 Other Resolutions Changes:

None

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal:	19 September 2019	(PSU19047)
	19 September 2017	(PSU17030)
	17 November 2017	(PSU17039)
	24 October 2017	(PSU18056)
	18 December 2019	(PSU19057)
Panel Approval:	12 October 2021	(PSU21026_ISUf)
GPG Approval:	08 February 2023	(22198_IGd)

• Rev.17 (May 2022)

.1 Origin of Change:

- o Based on IMO Regulation (MSC.Res.483(103))
- o Suggested by IACS Member

.2 Main Reason for Change:

To amend the minimum requirements of Thickness Measurements at Special Survey No.1 of Double-hull Oil Tankers in line with the amendments made to ESP Code vide Res. MSC.483(103).

To make definition of ballast tanks in UR Z10s in line with other IACS Resolutions

.3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

.4 History of Decisions Made:

- One survey panel member raised issue regarding requirements for thickness measurements at Special Survey No.1. Some require deck plating and measurements for general assessment of items subject to close-up surveys (tankers, chemical carriers, gas carriers) while others only require suspect areas (bulk carriers, ESDC, all Z7 vessels). With PSPC, there should be no wastage in ballast spaces at SS No. 1.

Noting that the mandatory requirement for the coating of cargo oil tanks of Regulation 3-11 of Chapter II-1 of SOLAS was adopted by Res. MSC. 291(87) and entered into force, panel members agreed to remove the requirements of thickness measurements in cargo oil tanks (items 2 and 4) of Special Survey No.1 in the Table II, and agreed to collect data from members about the results of the SS1 of enough vessels with the conditions about wastage, deficiencies in the areas relevant to the survey items 2 and 4 of SS1 in the Table II of UR Z10s.

Totally, 157 Double Hull Oil Tankers were collected and members concluded that based on the analysis to the datas collected by IACS members, it is concluded that the requirements of thickness measurements in cargo oil tanks (items 2 and 4) of Special Survey No.1 in the Table II of UR Z10.3 and Z10.4 could be removed, after a submission to IMO to amend the relevant contents of ESP Code being adopted.

It was submitted to SDC 7 and adopted as MSC.Res.483(103).

- One survey panel member pointed out that the definition of ballast tanks in UR Z10s are different from other IACS Resolution (UR Z7/Z7.1/Z7.2) and ESP Code. Survey panel reviewed and agreed to change “solely” to “primarily” in UR Z10s.

No TB is expected for the present revision.

.5 Other Resolutions Changes:

None

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal	: 01 March 2018	(Ref: PSU18011)
	28 January 2020	(Ref: PSU20004)
Panel Approval	: 11 April 2022	(Ref: PSU21024)
GPG Approval	: 03 May 2022	(Ref: 22043_IGb)

- **Rev. 16 (May 2019)**

.1 Origin of Change:

- Suggestion by an IACS member

.2 Main Reason for Change:

This revision is to address the policy decision made by GPG using the common terminology 'Condition of Class'(CoC) instead of the terms 'Recommendation/ Condition of Class' based on the outcome of III 5.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

During the 29th panel meeting, the panel discussed about the comments of members, and concurred with the view to retain the present definitions of CoC in the IACS resolutions with the wording 'Recommendation' to be removed. The panel also agreed to use the term 'Statutory Condition' for the 'recommendation' of the statutory certificates in IACS resolutions and RECs, and when discussing the proposal of a member to consider the harmonization of the terms of 'recommendation' and 'condition of class' in RO Code, the panel unanimously agreed to take no action on the IMO instruments, leaving the relevant actions to be decided by the relevant IMO bodies when IACS feeds back to IMO the IACS action on the harmonization of the two terms.

Panel members concurred with the view that it is not necessary to develop a new procedure requirement, and agreed to set the implementation date of these IACS resolutions (other than RECs) as 1st July 2020.

Before the implementation date of 1st July 2020 for using the common terminology 'Condition of Class' only, 'Recommendations' and 'Condition of Class' are to be read as being different terms used by Societies for the same thing, i.e. requirements to the effect that specific measures, repairs, surveys etc. are to be carried out within a specific time limit in order to retain Classification.

No TB is expected for the present revision.

.5 Other Resolutions Changes:

The following IACS resolutions and Recommendations (RECs) were agreed to be revised:

- Procedural Requirements: PR1A, PR1B, PR1C, PR1D, PR1 Annex, PR3, PR12, PR20, PR35 and the attachment of PR16;
- Unified Requirements: Z7, Z7.1, Z7.2, Z10.1, Z10.2, Z10.3, Z10.4, Z10.5, Z15 and Z20
- Unified Interpretations: GC13
- Recommendations: Rec.41, Rec.75, Rec.96, Rec.98

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal: 14 January 2019 tasked by GPG (17044bIGm)

Panel Approval: 22 March 2019 (PSU19010)
GPG Approval: 30 May 2019 (17044bIGu)

- ## Rev.15 (Jan 2018)

.1 Origin of Change:

☑ Suggestion by IACS members

.2 Main Reasons for Change:

In order to introduce new provisions into the ESP Code which were found among the ESP Code and relevant URZ10s, a series of items of UR Z10s shall be amended accordingly with ESP Code.

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Panel members discussed this issue under PSU17018: updating the CSR reference for both HCSR and CSR for oil tanker; figures 5-8 in paragraph 7.3 were to be replaced with new accurate figures; "Thickness measurement company" was to be replaced with "Thickness measurement firm" throughout the UR; some paragraphs were to be revised for consisting with ESP Code; etc.

During the 26th Survey Panel Meeting, the Panel discussed the divergence and reached agreements with the revisions.

No TB is expected for the present revision.

.5 Other Resolutions Changes

UR Z10.1, UR Z10.2, UR Z10.3, UR Z10.5

.6 Dates:

Original Proposal: 22 October 2016 by a Survey Panel Member
Panel Approval: 24 December 2017 by Survey Panel (Ref: PSU17018)
GPG Approval: 15 January 2018 (Ref: 17189_IGc)

- ## Rev.14 (Nov 2016)

.1 Origin of Change:

☑ Suggestion by IACS members

.2 Main Reasons for Change:
To address the Observation 04, raised by the IMO Auditing Team 5 of the IACS common package 1 in respect to the functional requirements (FR) 9-15.

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Based upon a GPG Member's proposal, the Panel examined, under the task PSU16017, the possible modification of the UR Z10.2 in order to include the verification of the Ship Construction File (SCF) during the class periodical surveys for those ships subjected to the requirements of SOLAS reg. II-1/3-10.
The suggested text was discussed by the Members and it was agreed that since the issue might be regarded as a proactive extension of the corrective action to OBS 04 this should be inserted under paragraph 6.4.2 of UR Z10.2.
Members reviewed the proposed text together with the relevant proposals of its modification; during the 24th Survey Panel meeting agreed to add the new paragraphs 6.4.2.1 and 6.4.2.2 dealing with the verifications of the Ship Construction File to be performed during the periodical surveys.

No technical background is expected for this revision.

.5 Other Resolutions Changes

The amendment affects UR Z10.2 and UR Z 10.5.

.6 Dates:

Panel Approval: 09 September 2016 - 24th Survey Panel Meeting
GPG Approval: 22 November 2016 (Ref: 16077_IGd)

- **Rev.13 (Feb 2015)**

.1 Origin of Change:

☑ Suggestion by an IACS member
☑ Other (following EMSA query received through IACS Accredited Representative to IMO)

.2 Main Reasons for Change:

a) To consider appropriate text in IACS document regarding the applicability of the Thickness Measurements when the Close up survey is performed.
b) To reword the note of Table I as appropriate in order to consider also the structures associated to corrugated bulkheads
c) To specify the minimum content of the Tank Testing guideline cited at paragraph 2.5.1.bullet a)
d) To correct a circular reference in paragraph 4.2.2.1 by modifying the table V

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) Following an ACB query an IACS member proposed to add suitable text in appropriate IACS documents regarding the application of the Thickness Measurements when the close up surveys are performed as survey requirement due at the Intermediate/ Renewal Class surveys. This Member expressed the view that the requirements to execute the Thickness Measurements of the area subject to Close Up Surveys are expected into the table relevant to "MINIMUM REQUIREMENTS FOR THICKNESS MEASUREMENTS AT SPECIAL SURVEY ………" while the paragraph 1.4 of the document contains only the requirement that "Thickness Measurements of the areas subject to close up surveys shall be taken in conjunction with the close up survey".

   Panel discussed the matter under item PSU13051 and considered that wordings of Para 1.4 of current UR Z7s/10s need to be revised in order to clarify this issue; finally Panel agreed to add additional wording to Para.1.4.

b) An IACS Member proposed to modify the note 7 of table I relevant to the structure of the longitudinal bulkheads in order to consider also the case where corrugated bulkheads are fitted. Being the structural arrangement of the corrugated bulkhead quite different from that of the plain bulkheads, the wording "longitudinal bulkhead vertical girder" was applicable only to plain bulkhead being the vertical girder not existing or differently realised for the corrugated type. Panel agreed to modify the wording from the existing one to "longitudinal bulkhead structural members".

   Considering items a) and b) Panel agreed

   1) to add additional wording to Para.1.4;
   2) to modify note 7 of table I

c) An IACS Member following the discussion of PSU 14017 (relevant to the drafting of a Guidelines for Master tank testing) proposed to improve the content of the bullet a) of paragraph 2.5.1 of the UR by inserting the description of the minimum requirements that need to be specified inside the "Cargo Tank Testing Procedure" to be used when Master of a Tanker is allowed to perform the cargo tank testing. Panel concurred with the proposal (ref. message PSU14017 ISUc), the sentence has been modified as follow
   "a tank testing procedure, <u>specifying fill heights, tanks being filled and bulkheads being tested,</u> has been submitted by the owner and reviewed by the Society prior to the testing being carried out";

d) Owing to a request of clarification by part of EMSA, relevant to the paragraph 4.1.2 of Annex B Part A of 2011 ESP Code (IMO Res. A.1049(27)) received from IACS Accredited Representative to IMO, Survey Panel performed a review of the corresponding paragraph 4.2.2.1 of UR Z10.4. Panel verified that a circular reference was present due to the content of table V. Panel agreed to modify the table by introducing a brief summary of the survey requirements based on the ship’s age. The task has been dealt with under Panel business PSU14025

e) A reference error was noted in paragraph 2.4.6: the requirements for the evaluation of the ship’s strength are set in paragraph 9.1.1.1 instead of the paragraph 8.1.1.1. The error has been corrected.

.5 Other Resolutions Changes

i) The amendment a) affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.2, UR Z10.3 and UR Z 10.5.
ii) The amendment b) affects also UR Z10.3
iii) The amendment c) affects also UR Z10.1, UR Z10.3

.6 Dates:

Panel Approval: Amendment a) at 19th Survey Panel Meeting (6 March 2014)
Amendment b) by correspondence under PSU13051
Amendment c) on 29 July 2014 by correspondence under PSU14017
Amendment d) on 29 August 2014 by correspondence under PSU14025

GPG Approval: 05 February 2015 (14193_IGc)

- **Rev. 12 (Jan 2014)**

.1 Origin of Change:

☑ Suggestion by IACS members
☑ Suggestion by GPG

.2 Main Reason for Change:

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.

b) To align the difference between PR37 and URZ's regarding safe entry to confined spaces.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) With reference to IMO Res. A1053 (27) (5.5 Application of "special circumstances") an IACS member proposed to add suitable text in appropriate IACS document regarding class period for lengthy conversions. This Member expressed that when a renewal survey has been completed, the new 5 year class period would normally be calculated from the expiry of previous class period/class certificate and in some cases this might result in unreasonably short time from one renewal survey completion until the next renewal would be due. (PSU13024)

Panel discussed and considered that wordings of Para 2.1.3 of current UR Z7s/10s (second sentence) could address this issue but finally agreed to add additional text to Para 2.1.3 in order to clarify this matter.

b) Panel discussed to clarify the survey requirements in PR37 and URZ's regarding safe entry to confined spaces. Panel considered that the safety issues of surveyor should be dealt by PR37. At 18th Panel meeting, Panel concluded to delete requirements from UR Z10s which were already covered by the PR37. (PSU13032)

.5 Other Resolutions Changes

a) The identical amendment affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.2, UR Z10.3 and UR Z 10.5.
b) The identical amendment affects UR Z10.1, UR Z10.2, UR Z10.3 and UR Z 10.5.

.6 Dates:

Panel Approval: 7 November 2013 by Survey Panel
GPG Approval: 14 January 2014 (Ref: 12011aIGd)

- **Rev.11 (June 2013)**

.1 Origin of Change:

☑ Suggestion by an IACS member
☑ Suggestion by GPG in response to the request of EG/SoS
☑ Suggestion by EG/GBS in response to GPG Chairman's request in 10060fIGg

.2 Main Reason for Change:

a) To establish a consistent practice among Members through amendments to the requirements related to pressure testing of cargo tanks with the correct level of safety for accepting Master's statement that the pressure testing has been carried out according to requirements.(Ref. PSU 9014, GPG 9640)

b) To introduce provision in UR Z10s that Rescue and emergency response equipment must be suitable for the configuration of the space being surveyed including the size of the access points.(Ref. PSU12032 GPG 12138_)

c) An inquiry from a member whether the 'Other equivalent means' referred in Para 5.3.2 of IACS UR Z10.2 include the use of Cherry Pickers for survey of other structures. (PSU 12022)

d) In order to comply with the IMO Goal Based Standard (GBS), it is required to update the Ship Construction File (SCF) throughout the ship's service life.

Therefore, procedures for updating SCF have been added in UR Z10s.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) Panel considered to revise the requirements in UR Z10.1 and Z10.4 for pressure testing of cargo tank bulkheads which are not adjacent to non-cargo tanks/space for oil tankers in order to accept Master's statement at class renewal survey.

   Survey Panel reported this issue to GPG and asked further instruction, and accordingly, GPG instructed Survey Panel to consider this issue based on two major opinions from GPG members (i. e. the 1st view was that IACS should expand UR Z10.1 and UR Z10.4 item 2.5.1 with a text similar to the one accepted for Chemical Carriers in UR Z10.3 item 2.5.1 while the 2nd view was that external boundaries of all cargo tank bulkheads adjacent to non-cargo tanks/spaces (e.g. facing ballast tanks, void spaces, pipe tunnels, fuel oil tanks, pump rooms or cofferdams) shall still be required to be tested in the presence of a Surveyor.

   Panel discussed and agreed to amend the requirement of para 2.5.1 of UR Z10.1 and UR Z10.4 in order to accept master's statement for cargo tank testing.

b) GPG Chairman requested to consider the suggestion of EG/SoS to clarify the wording in UR Z 10.1 – 10.5 to make it compliance with draft PR37 submitted by EG/SoS.

   The Survey Panel discussed this matter and introduced a new section 5.5 "Rescue and emergency response equipment" in line with the suggestion of EG/SOS.

c) Discussion of this matter initiated by a Panel member regarding the use of Cherry Pickers in Cargo Holds with reference of IACS URZ10.2. In accordance with UI SC191 and Rec 91, the Cherry Picker is allowed up to 17m height for Cargo Hold structure (ships constructed after 2006 for Alternative means of access). As per the provisions of URZ10.2, Cherry pickers are allowed for survey of side shell frames only.

   Panel discussed and considered that Para 5.3.2 of UR Z10.2 allows the use of Cherry Pickers as 'Other equivalent means'. Accordingly, Panel agreed to clarify this matter by including text "hydraulic arm vehicles such as conventional cherry pickers" to UR Z10s and UR Z7s for a ship not subject to the above 17m restriction.

d) At the time of reviewing the revised UR Z23 which is followed only for new construction, PT/GBS proposed that URZ10s should have provisions for updating Ship Construction File (SCF) since it would be maintained throughout the ship's service life.
   Survey Panel at its 17th meeting discussed the proposals of PT/GBS for the revision of UR Z10s in order to comply the IMO GBS requirements for existing vessels. Panel agreed to add new text in URZ10.4 for updating and monitoring the SCF.

.5 Other Resolutions Changes

a) The identical amendment affects UR Z10.1
b) The identical amendment affects UR Z10.1, UR Z10.2, UR Z10.3, and UR Z 10.5.
c) The identical amendment affects UR Z7, UR Z7.1, UR Z10.1, UR Z10.2, UR Z10.3, and UR Z 10.5.
d) The identical amendment affects UR Z10.2 and UR Z10.5.

.6 Dates:

Panel Approval: 7 *March 2013 during Survey Panel Meeting*
GPG Approval: 5 June 2013 (Ref: 9640_IGn & 10060fIGn)

- **Rev.10 (July 2011)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reason for Change:

Following external audit a member was advised that a small temporary doubler on a cross-deck strip of a bulk carrier should have been promptly and thoroughly repaired at the time of survey. The member carried out an investigation and found that the actions of the surveyor were fully justifiable, the temporary repair and short term Condition of Class imposed were an appropriate method of dealing with such a situation. The member advised that the current requirements for 'Prompt and Thorough Repair' stipulated under the UR 7 and UR 10 series do not give any leeway for carrying out temporary repairs (and imposing a Recommendation/Condition of Class in accordance PR 35) where the damage in question is isolated and localised, and in which the ship's structural integrity is not impaired.

The Survey Panel discussed the matter and agreed that under carefully defined circumstances a temporary repair and short term Recommendation/Condition of Class would be an appropriate course of action.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

The matter was discussed by correspondence within the Survey Panel and at the Autumn 2010 Panel Meeting. Following discussion at which the possibility of a Unified Interpretation being raised was considered, it was eventually decided to make direct amendment to the relevant Unified Requirements.

The wording of the new paragraph to be inserted as Para 1.3.3 in all relevant Unified Requirements was extensively discussed prior to agreement.

The proposal was unanimously agreed by Survey Panel Members.

.5 Other Resolutions Changes

The identical amendment affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.2, UR Z10.3, UR Z10.4 and UR Z 10.5.

.6 Dates:

Original Proposal: *September 2010 Made by a Member*
Panel Approval: *March 2011*
GPG Approval: *27 July 2011 (Ref: 11118_IGb)*

- **Rev.9 (Mar 2011)**

.1 Origin for Change:

☑ Suggestion by IACS member

.2 Main Reason for Change:

1) Inconsistency of the definition of transverse section of the ship given in URZ7 and URZ10s.

2) Update of references in the Executive Hull Summary Table IX.

3) To make the survey requirements in UR Z10.4 compatible with the new requirements contained in CSRs.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None.

.4 History of Decisions Made:

Item 1) was proposed by RS and item 2) was proposed by GL. Both amendments were agreed by the Panel.

Regarding item 3), The Survey Panel Members decided that the task would be carried out by a Project Team, rather than through correspondence within the Panel. The PT was composed by three Members from the Survey Panel and one Member, external to the Panel, who was expert both in surveys and in structural matters. Subsequently the PT requested the Small Group on Strategy & Steering Committee that the PT were enlarged with the joining of two additional Members of the Hull Panel, in order to increase the PT's expertise in the CSRs based on the fact that CSRs would be amended, even if limitedly to requirements related to surveys after construction. The Small Group on Strategy & Steering Committee fulfilled the PT request.

.5 Other Resolutions Changes

UR Z10.1, Z10.2, Z10.3 and Z10.5.

.6 Dates:

Original Proposal: *January 2010, made by Survey Panel*
Survey Panel Approval: *July/November 2010*
GPG Approval: *24 March 2011 (Ref: 10170_IGe)*

- ## Rev. 8 (Feb 2010)

.1 Origin for Change:

☑ Suggestion by IACS member

.2 Main Reasons for Change:

As MARPOL I was revised, the reference to MARPOL I/13 (3) in paragraph 1.2.2bis should be changed.

.3 History of Decisions Made:

GL proposed the change and it was agreed by the panel.

.4 Other Resolutions Changes

UR Z10.1

.5 Any dissenting views

None

Addition of text in paragraph 1.2.9 relating to CSR.

See TB document in Part B.

- **Rev. 3 (Jan. 2006)**

Survey Panel Task 22 – *Amend applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process* – plus additional changes relating to access for rafting surveys.

See TB document in Part B.

- **Rev. 2 (Jun. 2005)**

WP/SRC Task 102 - *Harmonization of UR Z7s and Z10s*

See TB document in Part B.

- **Rev. 1 (Oct. 2002)**

UR Z10.1, 2, 3 and 4 revisions (WP/SRC tasks 91, 93 and 95)

No TB document available.

- **New (Dec. 2001)**

WP/SRC submitted the draft Z10.4 (Task 66) to GPG for approval. GPG/Council approved Z10.4 for submission to IMO DE 45 on 14 December 2001.

See TB document in Part B.

Part B. Technical Background

List of Technical Background (TB) documents for UR Z10.4:

Annex 1. **TB for New (Dec 2001)**

See separate TB document in Annex 1.

Annex 2. **TB for Rev.2 (Jun 2005)**

See separate TB document in Annex 2.

Annex 3. **TB for Rev.3 (Jan 2006)**

See separate TB document in Annex 3.

Annex 4. **TB for Rev.4 (Jun 2006)**

See separate TB document in Annex 4.

Annex 5. **TB for Rev.5 (Feb 2007)**

See separate TB document in Annex 5.

Annex 6. **TB for Rev.6 (Nov 2007)**

See separate TB document in Annex 6.

Annex 7. **TB for Rev.7 (Mar 2009)**

See separate TB document in Annex 7.

Annex 8. **TB for Rev.8 (Feb 2010)**

See separate TB document in Annex 8.

Annex 9. **TB for Rev.9 (Mar 2011)**

See separate TB document in Annex 9.

Annex 10. **TB for Rev.10 (July 2011)**

See separate TB document in Annex 10.

Annex 11. **TB for Rev.12 (Jan 2014)**

See separate TB document in Annex 11.

Note: *There are no separate Technical Background (TB) documents for the Rev.1 (Oct 2002), Corr.1 (Sept 2006), Rev.11 (June 2013), Rev.13 (Feb 2015), Rev. 14 (Nov 2016), Rev.15 (Jan 2018), Rev.16 (May 2019), Rev.17 (May 2022) and Rev.18 (Feb 2023).*

Technical Background Document
WP/SRC Task 66
New UR Z10.4 for Double Hull Oil Tankers

Objective and Scope:

To Develop a Unified Requirement for Enhanced Surveys of Double Hull Tankers along the lines of UR Z10.1 but tailored to the structural configuration of double hull tankers and other features which distinguish double hull tankers from single hull tankers and with a view to submitting the outcome to IMO for incorporation in future amendments of A.744(18).

Source of Proposed Requirements:

WP/SRC developed Z10.4 in collaboration with the Permanent Secretariat through correspondence and their meeting. IACS' Post Erika measures have been incorporated in the proposed draft. In addition, Res MSC.105(73) and 108(73) have been introduced into Z10.4 since entry into force date of the aforesaid MSC Resolutions is 1 July 2002.

Points of Discussion:

WP/SRC unanimously agreed to the proposed draft UR Z 10.4 except with respect to 3.2.5.2. The majority of WP/SRC agreed to the proposed text of 3.2.5.2 whereas ABS and NK preferred the corresponding text of Z10.1.

Submitted by the permanent Secretariat

On 11 December 2001

WP/SRC Task 102
HARMONIZATION OF UR Z7s AND Z10s

Technical Background
UR Z7 (Rev. 11)
UR Z7.1 (Rev. 2)
UR Z10.1 (Rev. 12)
UR Z10.2 (Rev. 17)
UR Z10.3 (Rev. 7)
UR Z10.4 (Rev. 2)
UR Z10.5 (Rev. 1)

Contents:

1. Objective

To amend UR Z7s and Z10s in order to make the texts of the above-mentioned URs consistent eliminating all the differences both in substance and in wording (WP/SRC Task 102).

2. Background

In the process of approving UR Z10.4, GPG found it necessary to amend the other existing URs Z10.1, Z10.2, Z10.3, Z10.6 and Z7 in order to eliminate any inconsistencies existing among them.

3. Methodology of work

The WP has progressed its work through many sessions, both during the periodical meetings and dedicated meetings restricted to a Small Group of Members (BV, DNV, GL, LR, RINA) who developed the work in order to be more efficient. All the proposed amendments of the Small Group have regularly been circulated to all Members for comment and agreement.

4. Discussion

4.1 The WP/SRC has completed a comprehensive comparative review of UR Z7 and Z10s, and identified inconsistencies which existed among them. During this review, attention was given to the severity of the requirements applicable to the same spaces/structural areas on different types of ESP ships. As a result, the inconsistencies were eliminated making the URZs harmonized. However, there has been no change to the scope and extent of the survey requirements.

4.2 The starting point for each UR was the most updated version available at the time of commencement. Any revision to the URZs, which were introduced during this task, was taken into account. As for instance, the UR Z10.1 was initially amended based on Rev. 9, while the last amendments are based on Rev. 11 and the UR Z10.2 was initially amended based on Rev. 13, while the last amendments are based on Rev. 16. The proposed revisions of URs Z10.1 and Z10.4 have not been numbered, as there will be revisions to those URs before the revisions introduced by the Task 102 are adopted. In fact, GPG is currently developing a Revision 12 of Z10.1 with the view to introducing significant improvements in the survey regime for ballast tanks (including combined cargo/ballast tanks) of oil tankers and UR Z10s applicable to oil tankers will also have to be revised by incorporating the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005 (see 4.3 below).

4.3 Also, in harmonizing UR Z10.1 and Z10.2 care has been taken to align the corresponding text with that of IMO Res. A.744(18). However, it has been noted that the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005, have not been incorporated into the IACS UR Z10s applicable to oil tankers. It seems that the updating of the above-said UR Z10s will be done by the Perm Sec and reviewed by the WP/SRC Chairman and then circulated for adoption by GPG with concurrence of Council Members for uniform application from 1 January 2005. It is understood that the revisions of the UR Z10s affected by those amendments will not include the changes introduced by the Task 102, as the implementation date proposed for those changes is 1 January 2006 (see below **6. Implementation**).

4.4 In the course of the work the WP has been developing for more than two years, several additional Tasks were assigned to the WP by GPG which affected the development of Task 102. The additional tasks which have been taken into account are the following:

1) In the course of Council discussion on UR Z10.6 (General Cargo Ships), certain inconsistencies were identified between Z10.6 and other Z10s. WP was instructed to expedite Task 102 (1060gIAa, 12 June 2002);
2) WP was instructed to include “Survey Planning for Intermediate Survey” into harmonization work (2108_IAa, 12 July 2002);
3) GPG instructed WP to consider whether Z10.6 should be re-assigned as Z7.1, in connection with the harmonization work. 1060gIAb, 20 Sept 2002.

Z7.1 developed;

4) Partial outcome (Z7 and Z7.1) was submitted to GPG on 17 July 2003(1060g). Council decided that approval of Z7(Rev.10) and Z7.1(Rev.2) is postponed until the harmonization is completed (1060gICb, 6 April 2004); Council Chairman instructed WP/SRC to Members' comments on the draft revision of UR Z7 and Z7.1 (collected under s/n 1060g, 1060gNKi (30/03/2004) in particular) on 6 April 2004.

5) GPG tasked WP to include the amendments to Z10.2 / Z11 (BCs with hybrid cargo hold arrangements), deleting sheets 15 and 16 for ore carriers, into the harmonized UR Z10s (2212aIGa, 19 Jan 2004);
6) GPG tasked WP to consider whether the requirements relevant to examination of Fuel Oil Tanks in the cargo area at each Special Survey should be put into Z 10s, and internal examination of FOT at Intermediate Survey after SS 2 is needed. (1060gIAf, 30 Jan 2004);
7) GPG tasked WP to harmonize tank testing requirements in Z7s and Z10s. (3006lIAa, 5 April 2004);
8) GPG tasked WP with Task 108 - Develop uniform survey requirements for air vent pipes including the welded connection to deck. Z22 developed. GPG instructed WP to incorporate Z22 into the harmonized Z10s;
9) GPG tasked WP with Task 114 - Verification and signature of TM reports. REC 77(Rev.1) developed and approved on 29 July 2004. Council approved parallel amendments to Z7.1 and Z10s (TM Forms included) and instructed WP to incorporate these into the harmonized Z10s:
    - Recommendation No.77 was revised (Rev.1, July 2004);
    - Z7.1 para.6.3.2 and Z10s para.7.3.2 so amended.
    - "Surveyor's signature" is deleted from all TM Forms in Z10s;
    - A note is added to Annex II(Z10s) declaring that Annex II is recommendatory.

   WP/SRC's investigation into Members' practice in dealing with verification and signature of TM reports is annexed for record keeping purpose. See Annex 2.

10) GPG tasked WP to consider the BV comments on "TM may be dispensed with…." and include the findings into the harmonized Z10s (2219iIAa, 7 April 2004).

5. Agreement within the WP/SRC

All Members have unanimously agreed the attached final versions of UR's.

6. Implementation

WP/SRC is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming Council adoption in December 2004, WP/SRC would propose January 2006 as implementation date.

Annex 1: TB for UR Z10.1(Rev.12, C49 amendments, see Permsec's note 1 below)
Annex 2: WP/SRC Task 114, verification and signature of TM reports(see 9 above).
Annex 3**:** TB for revision of UR Zs concerning "anodes".

Note by the Permanent Secretariat

1. Annex 1 to this TB contains background for amendments to UR Z 10.1(Rev.12) relating to FAIR/POOR/GOOD (C49 amendments). Council at its 49th meeting (June 2004) agreed/decided that comparable changes should be added to Z10.3 and Z10.4.

2. Appendix 3 "TM sampling method" has been added to UR Z10.1 and Z10.4 to keep them consistent with IMO Res.MSC.144(77). The amendments to A.744 contained in MSC.144(77) entered into force on 1 January 2005. *(GPG s/n 4181)*

Under s/n 4072g, paragraph **2.4.6** of UR Z10.1 and **2.4.6** and of UR Z10.4 (paragraph numbering is now harmonized) were amended in order to provide a link between the main text of the UR Z10.1 and 10.4 and the new Annex III Appendix 3 containing the MSC Res.144(77).

Further, it was agreed that the requirements for evaluation of longitudinal strength of the hull girder (as written in MSC.144(77)) should not be required for Intermediate Survey unless deemed necessary by the attending Surveyor. This is covered in 4.2.3.1 and 4.2.4.1 of Z10.1 and Z10.4.

3. GPG agreed that the amended UR Zs should be implemented from 1 July 2006 altogether.

4. DNV's proposed amendments to UR Z10.1, Z10.3 and Z10.4 concerning annual survey of ballast tanks were agreed by Council (1060gICq, 27 June 2005). See Appendix 2 to Annex 1.

5. Annex 3 contains a TB for revision of UR Zs concerning "anodes".

Date: September 2004
Prepared by the WP/SRC

– – –

Annex 1 to Technical Background
UR Z 10.1 (Rev.12, C49 amendments(coating-related))

1. Objective

To introduce significant improvements in the survey regime for ballast tanks (including combined/ballast tanks) of oil tankers as matter of strategic concern and urgency to IACS, given the aging of both the single and double hull tanker fleets and the problems encountered with corrosion of ballast tanks in several shipping casualties.

2. Background

Draft amendments to UR Z10.1 were submitted to Council 47 (June 2003) and agreed in principle.

3. Discussion

There was particular concern over accelerated corrosion with age (as the thinner the material, the more rapidly the allowable diminution margin percentage disappears) especially where coatings have broken down. There is also a disincentive for any spend on maintenance of the structure of a ship within a few years of its statutory scrapping date.

Council discussion by correspondence had evolved to the position of substantive proposals – summed as follows (3095_ABa, 2 June 2003):

1. Enhance the Intermediate Survey in Z10.1, Z10.3 and 10.4 for Tankers after 2nd Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey). This corresponds to the latest revision to UR Z10.2.
2. At Annual Survey of ballast tanks with substantial corrosion, the overall survey is to be replaced by close-up survey with thickness measurements of the exposed area.
3. Proposed to task WP/SRC to re-consider the acceptance criteria for the rating FAIR further. For this, eliminate FAIR, leaving only GOOD and POOR redefined as appropriate.
4. Proposed to task WP/SRC to explicitly require close-up survey of Suspect Areas identified at the previous Special Survey.

Council 47 discussed the proposals(June 2003) as follows:

1. Definition of FAIR
   Council 47 agreed that "FAIR" would be retained as a rating and that GPG should instruct WP/SRC to redefine FAIR, so that there would be a clear differences between FAIR, POOR and GOOD. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have the same scope as Special Survey No.2(Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

   Based on the strong majority, Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

   > *DNV and NK stated that they could not accept a requirement for annual surveys of ballast tanks when the coating condition is less*

than GOOD and proposed that GOOD be changed to FAIR (3095_IGc, 30 June 2003)

2. ABS' proposed amendments to Z10.1(annual examination of BWTs in certain conditions) were approved.
3. C 47 agreed that the BWT coating requirements (Z10.1.2.2.3) for intermediate Survey after SS 2 should be the same extent to the previous SS.
4. Given the substance of the changes, the revised Z10.1 should be shown to Industry before adoption.
5. A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.

Following Council 47, the draft text of Z10.1(Rev.12) was distributed to Industry and discussed at the IACS/Industry meeting on 29 August 2003. Industry indicated that UR Z10.1(Rev.12) is acceptable, provided that appropriate IACS guidelines on coating repairs are developed.

The Small Group on Coating (SG/Coating) under WP/SRC prepared draft guidelines on coating repairs and considered the definitions of GOOD / FAIR / POOR. The SG/Coating did not change the definitions and found that the Guidelines provide useful clarifications on the definitions and criteria in achieving an industry wide uniform judgement of coating conditions as well as what is needed to restore GOOD conditions.
Further, an IACS/Industry JWG/Corrosion was established and met in February 2004. The outcome is (3095_IGh, 4 June 2004):

- Draft Guidelines on Coating Repair (IACS REC 87)
- Draft UR Zxx (mandatory coating of cargo tanks on oil tankers)
- Draft UI SC 122 (Rev.2) – mandatory coating of ballast tanks

4. Others

1. Z10.11.2.2bis - Definition of "Combined Cargo/Ballast Tank. …as a routine part of the vessel's operation and will be treated as a Ballast Tank. ...". By so amending, Z10s do not need to repeat "Ballast Tanks *and Combined cargo/salt water Ballast Tanks*" in addressing the ballast tanks. Hence, all the references to "*and Combined cargo/salt water Ballast Tanks"* were deleted.
2. Z10.1.2.2.1.2: The aim of the examination is ~~to be sufficient~~ to discover substantial corrosion…
   Comparable changes are to be added to other UR Zs wherever the same sentence occurs.
3. "IACS Guidelines for Coating Maintenance & Repairs for Ballast Tanks and Combined/Ballast tanks on Oil Tankers" are referenced where relevant.
4. Comparable changes are to be added to UR Z10.3 and Z10.4, after adoption of Z10.1(Rev.12).

Attached: Memo on Coating Matters (GPG Chairman)

9 June 2004
Prepared by the Permsec

Appendix 1 to Annex 1: MEMO on Coating matters

1. Background and discussion within IACS on UR Z10.1 (draft Rev.12) between 29/01/03 and 14/08/03

In view of the survey experience with oil tankers, it was proposed that all ballast tanks should be examined, routinely and uniformly, at annual surveys on ESP tankers exceeding 15 years of age. IACS should amend UR Z10.1 to require the examination of ballast tanks on such ships at each annual survey. This is simple, clear and thorough and not subject to interpretation. (2242_ABq dated 29/1/03)

Then, ABS modified the proposal asking, for tankers subject to URs Z10.1, Z10.3 and Z10.4, exceeding 15 years of age, that the current requirement - pertaining to annual examination of Ballast Tanks adjacent to cargo tanks with any means of heating - be deleted and replaced by a simpler and more stringent requirement that all Ballast Tanks be subject to survey at each subsequent annual survey where either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and the protective coating is not renewed at special survey or intermediate survey. This will ensure that all Ballast Tanks with substantial corrosion or protective coating which is not in GOOD condition at the time of special survey or intermediate survey will be examined at each subsequent annual survey on tankers exceeding 15 years of age. (2242_ABzb dated 14/3/03)
This was later expanded to include all tanks used routinely for ballast water, both ballast-only and cargo/ballast tanks (2242_ABzc dated 14/3/03).

ABS further reviewed the issue of the survey of salt water ballast spaces and combined cargo/salt water ballast spaces with ABS' governing bodies in light of recent casualties and survey findings on other tankers. Their review found an increasing amount of coating breakdown/failure and subsequent rapid wastage in key structures after Special Survey No. 2, i.e. after 10 years of age. These conditions are most prevalent in the under deck structure and the side shell structure in way of the deep loadline. In a number of cases the serious wastage has caused fracturing of the under deck longitudinals and in some cases fracturing has extended to the main deck structure. This led ABS to refine proposed amendments to URs Z10.1, Z10.3 and Z10.4 to require (2242_ABzf dated 9/5/03):

a. For Tankers exceeding 10 years of age

> Salt Water Ballast Spaces and Combined Cargo/Salt Water Ballast Spaces. For tankers exceeding 10 years of age, salt water ballast spaces and combined cargo/salt water ballast spaces are to be internally examined at each subsequent Annual Survey where substantial corrosion is found within the tank or where the protective coating is found to be less than GOOD condition and protective coating is not repaired. Internal examination to be an Overall Survey.

b. For Tankers exceeding 15 years of age:

Salt Water Ballast Spaces and Combined Cargo/Ballast Spaces. For tankers exceeding 15 years of age, salt water ballast spaces and combined cargo/ballast spaces are to be examined internally at each subsequent Annual Survey. Where substantial corrosion is found within the tank, or where the protective coating is found to be in less than GOOD condition and the protective coating is not repaired then in addition to an Overall Survey, under deck structure and the side shell structure in way of the deep loadline is to be subject to Close-up Survey.

NK and BV replied that the proposed amendments made by ABS need to be substantiated in a transparent manner with technical data that ABS may possess and put forward for further assessment and discussion. (2242_NKn dated 14/5/03 and 2242_BVz dated 16/5/03)

DNV (2242_NVn dated 2/6/03), having carefully considered the practical consequences of taking the ship off-hire for gas freeing etc. and being concerned about the difficulties to have these surveys executed in a safe manner and whether the intended safety benefits in implementing the proposed extended scope of the annual survey of Ballast tanks will be met, **proposed the following alternative measures** which would be as effective and may not have such delaying effects to the ship:

1) Enhance the Intermediate Survey in UR Z10.1, 10.3, and 10.4 for Tankers after the 2 Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey. (This will correspond to the latest revised requirements of UR Z10.2 for Bulk Carriers.)
2) At Annual Survey of ballast tanks with substantial corrosion the overall survey should be replaced by close up survey with thickness measurements of the exposed area. (An overall survey of these tanks does not give sufficient information of the development of the areas with substantial corrosion.)
3) Further we will not fail to mention that the WP/SRC has proposed to extend the close up survey in cargo and combination tanks to 30% from the 3 Special / Renewal Surveys.
4) **Experience has shown that the coating condition rating category FAIR has a tendency to be stretched too far into the POOR condition. We will therefore propose that we task the WP/SRC to reconsider the acceptance criteria for the rating FAIR further.**
5) We do also question the need for redefining the definition of combination tanks, particularly since the category I tankers which are the ships that normally are fitted with these type of tanks are to be phased out 2 to 4 years from now. However DNV will not oppose to such a redefinition.

DNV requested Members to consider the above as an alternative to the ABS proposal, bearing in mind that we ought to present this to the industry prior to deciding.

ABS (3095_Aba dated 2/6/03), having further considered its earlier proposals in light of NVn, submitted a revised proposal for consideration by Council at C47 and replied to the above 5 DNV proposals as follows:

1) ABS fully supports this proposal.
2) While ABS agrees with this proposal, it is in fact already provided for in Z7 (3.2.3) and Z10.1 (3.2.5.1)--which require that "Suspect areas (which include any area where substantial corrosion is found) identified at previous Special Survey are to be examined. Areas of substantial corrosion identified at previous special or intermediate survey are to have thickness measurements taken." To us, this implies that close-up survey of these areas is to be done at annual survey in conjunction with the thickness measurements. However, we can

agree to tasking WP/SRC to explicitly require "close-up" survey in this connection and to amend Z7, and all the Z10's, appropriately to make this explicit, if there is majority support for this.

3) We agree that this has been put forward to GPG by WP/SRC via 0237hNVb, 27 May. However, these additional CAS close-up survey requirements do not apply to salt water ballast tanks; only to cargo oil tanks and combined cargo/ballast tanks.
4) **We agree with this assessment and we propose that the only way to eliminate the subjectivity and raise the standard is to eliminate the category "FAIR" completely; leaving only "GOOD" and "POOR" redefined as follows:**
   "GOOD -- condition with no breakdown or rusting or only minor spot rusting.
   POOR -- any condition which is not GOOD condition."
5) ABS does not agree with this proposal. We are particularly concerned that we need a very thorough and robust survey regime for these tankers precisely because they are subject to mandatory phase out over the next several years. We are very concerned that without additional IACS requirements, these tanks will receive little or no inspection and maintenance by owners or others after their last special or intermediate survey, if no substantial corrosion is found at that time. Rapid, localized wastage in way of deteriorating coatings may pose significant hazard if the survey regime is not further tightened as we are proposing.

In conjunction with the above comments on DNV proposals, ABS further considered their previous proposal in ABzf and modified it as follows:

- **ABS simplified the proposal to require annual examination of all salt water Ballast Tanks and combined Cargo/salt water Ballast Tanks irrespective of age, when either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and is not repaired.**
- the requirement for annual (close-up) examination of salt water ballast tanks and combined tanks is already required in Z10.1 (3.2.5.1). ABS proposed adding it to 2.2.3 for clarity and emphasis so that all the conditions which may lead to annual examination of such tanks are listed together in one place.
- Since the principal problem that we are trying to address is rapid, localized corrosion in way of breakdown or deterioration of the protective coating, we are proposing that the coating condition should be found and kept in "GOOD" condition to obviate the need for annual examination. **The attached proposal is made together with the proposals in items 3.1 (intermediate following Special survey 2 to have same scope as prior Special survey) and 3.4 (eliminating "FAIR" and redefining "POOR" as any condition other than "GOOD" condition.**

ABS requested to decide on a course of action at C47 for tightening the survey regime for tankers. They agreed that industry be informed of Council's decisions in this regard prior to IACS making the decision public, but IACS should maintain its independence and take decisive action in this matter. Debate with industry can only lead to delay and to a watering down and compromising of these important requirements.

NK agreed to task WP/SRC to reconsider the acceptance criteria of "FAIR" for clearly define the border between "FAIR" and "POOR" condition. However, **NK strongly opposed the elimination of "FAIR" coating condition from UR Zs** because this can not resolve to remove subjectivity of coating assessment. The three-categorization system of coating condition should be retained. (3095_NKa dated 5/5/03)

<u>Outcome of C47</u>

At **C47**, it was agreed that "Fair" would be retained as a rating and that GPG should instruct WP/SRC to redefine "Fair", so that there would be a clear differentiation between "Fair", "Poor" and "Good". It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have same scope as Special Survey No.2 (Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

Based on strong majority support Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

This matter should be discussed with Industry prior to adoption of any UR by Council.

In a final summary, the Chairman proposed that a constructive dialogue with Industry should take place on the IACS proposal as set out in WP1 plus maintaining 3.2.5.2 modified to say that ballast/combined ballast/cargo tanks will be subject to annual survey when considered necessary by surveyors.

After discussion in the JWG (Industry/IACS), GPG should propose final rules for this matter to Council, including acceptable repair definition.

F**UA 17:** *To instruct WP/SRC to develop guidance on coating repairs and more precise definition of "Fair" coating condition.*

Once approved, these requirements should be incorporated into Z10.3 and Z10.4.

FUA 15

1) *To prepare a draft revision to UR Z10.1 incorporating C 47 decisions:*
   - *The definition of "FAIR" remains as it is;*
   - *ABS proposed amendments to Z10.1 (annual examination of BWTs in certain conditions) were approved;*
   - *C47 agreed that the BWT coating requirements (Z10.1.2.2.3) for Intermediate Survey after Special Survey No.2 should be the same extent to the previous Special Survey.*
   - *Given the substance of the changes, the revised UR Z10.1 should be shown to Industry (OCIMG/Intertanko first among others) before adoption for their review and comments.*
   - *A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.*

2) *GPG Members are to confirm the draft revision to Z10.1 in consultation with their WP/SRC members by correspondence. See 3095_IGa of 13/06/03.*

According to C47 FUA 15, GPG Chairman circulated (3095_IGa dated 13/6/03) draft amendments to UR Z10.1 as agreed in principle at C47.

Having received a number on comments, GPG Chairman (3095_IGb dated 27/6/03) informed that the Council Chairman confirmed that GPG is not to amend the principles agreed at C47, i.e. we are not empowered to change "GOOD" to "FAIR" as proposed by DNV and NK, nor to amend the definitions of "FAIR" and "POOR" as proposed by DNV.

DNV's intention to possibly lodge a reservation was noted, however the matter should be raised at Council and not be dealt with by GPG. An amended draft text incorporating the non-substantive changes proposed by Members was circulated.

DNV said that its understanding was that the draft should be circulated to the Industry (ICS, INTERTANKO, and BIMCO) prior to adoption by Council. (3095_NVc dated 30/6/03)

GPG Chairman (3095_IGc dated 30/6/03) circulated a draft amendment of UR Z10.1 for Council's agreement and use in discussions with the industry associations.
The draft was generally agreed by GPG but individual Members have requested that the following matters (which were deemed to be outside the remit of GPG in this task) be brought to Council's attention for further consideration:

1 DNV and NK stated that they can not accept a requirement for annual surveys of ballast tanks when the coating condition is less than GOOD and propose that GOOD be changed to FAIR.
2 In connection with item 1 above, DNV also propose to amend the definitions of FAIR and POOR in order to raise the standard of FAIR.

Council Chairman (3095_ICb dated 14/8/03) concluded that Council has agreed that the draft amendments to UR Z10.1 attached to IGc reflect Councils' decision taken at C47 and that they be circulated to industry associations.
Perm Sec was therefore invited to submit the draft to OCIMF and INTERTANKO in view of discussion at the IACS/ industry meeting on 29 August.

2. Discussion with Industry (29/08/2003 – 11/10/2003)

As requested by Council, the whole matter was presented to Industry during the "general matters" meeting with IACS held on 29 August 2003; comments from Industry were requested. In the following an extract from the minutes of the meeting (see message 3100aIAb dated 5 September 2003):

__________________________ from Meeting minutes ________________________________

4. & 5. Annual surveys of ballast tanks and IACS guidelines on coating repairs

M. Dogliani introduced the matter (see Items 4&5 in Appendix).

A. LinoCosta gave a presentation to show where concerns and decisions stand: too many cases when coating was considered fair at SS but problems occurred just after one/two years.

N. Mikelis commented on draft amendments to Z10.1 (Rev.11) stating that the extent of annual survey is not clear; it should be limited to the affected zones, e.g. coating breakdowns, only.
M. Guyader clarified that, in this draft amendments, it is expected an overall survey of the whole tank and a close up survey of the affected zones.
N. Mikelis noted that, in the draft amendments to Z10.1 (Rev.11), the intermediate survey at 12.5 years would have the same scope as the previous special survey and that needed a justification. See 7 a).
M. Dogliani said that Z10.1 (Rev.11) was adopted in August 2003 and will be introduced into IACS Societies' Rules over the next year.

Conclusions:
4.1 Industry shared IACS concerns on coatings and, in general, agreed with the draft amendments to Z10.1 (Rev.11) suggesting also extending them to Z10.2 on bulk carriers

4.2 Industry agreed that a guideline for surveyor on coating would greatly improve uniform application of so-amended Z10.1 including issues such as how to consider load bearing elements when judging GOOD/FAIR/POOR status and how to consider bottom pitting in connection with GOOD conditions
4.3 Industry will more precisely comment, by the end of September, the draft Z10.1 so as for IACS to finalise the matter, as planned, for the Council's December meeting.

Item	Title	Industry recommandation	IACS/ M. Dogliani Introduction
4 & 5	Annual survey of ballast tanks IACS guidelines on coating repairs	NN	**1. IACS is considering the following:** - **amend UR Z10.1 (draft circulated to Industry) to the effect that in case at Special Survey or Intermediate Survey the coating in a ballast tank is found less than GOOD, either GOOD conditions are restored or the tank's coating is inspected at each annual survey;** - **develop IACS guideline to assist an uniform application of the so modified (if adopted) UR Z10.1; the guideline should address which repairs are necessary to restore GOOD conditions from FAIR and POOR respectively and which are the criteria for the restored (after repair) situation to be rated as GOOD.**

______________________________ End of extract from minutes ____________________________

INTERTANKO commented (see R. Leslie email to GPG dated 25 September 2003):

- expressing their concern for the draft Z10.1 and underlining

a) targeting: concerns that, if not properly dealt with, Z10.1 would target all ships and not just those which need intervention; the view was expressed that guidelines would probably solve the matter;

b) definition: indicating that the current definitions of GOOD, FAIR and POOR is not clear enough and that the matter would be even worst with GOOD and NON GOOD; again it was indicated that guidelines could solve the matter;

c) expertise: expressing doubts on IACS' surveyors expertise and ability to judge coating conditions; in this respect they (hiddenly) suggest that IACS position is unclear when we say that we are not competent to judge the coating during construction but then we are competent to judge coating during operational life. Even if not explicitly stated, the impression is that also in this case guidelines would help.

Additionaly, INTERTANKO suggested a (quite detailed) set of assessment criteria.

The matter was then finally addressed at the TRIPARTITE Meeting (held in Soul on 29/30 September 2003). There Industry agreed that the way forward was the (joint) development of IACS guidelines (see minutes attached to message 3100_RIe dated 11 October 2003, an extract of which is reproduced below).

______________________________ Extract from the TRIPARTITE minutes ________________

Industry is concerned by the definition of GOOD/NOT GOOD in relation to coating repairs and acceptance criteria. Industry agreed that new guideline on this, which IACS is already producing, was the way forward.

________________________________ End of the extract from the minutes ___________________

3. Further developments

a) from the above, it was concluded that, provided the guidelines are sound, Industry would accept the concept of Z10.1 (draft) Rev. 12, therefore an IACS team and a JWG were established in order to progress the matter of the guidelines (among other related matters).
b) the team of IACS experts on coating developed draft guidelines and provided recommendations to GPG on the way forward (attached to message 3095bNVc dated 20 November 2003).
c) the guidelines were discussed within the JWG with Industry (see draft minutes circulated within GPG with messages 3095cIGd and 3095cIGe both dated 13 March 2004)
d) further suggestions and comments (as requested at the meeting) were provided by Industry (not circulated to GPG)
e) Bulk Carrier Industry is recommending that similar guidelines are developed in due time also for bulk carriers
f) at DE47 and MSC78, IMO is asking Industry and IACS to develop (compulsory) performance standards for coating of newbuilding (double hull spaces of DSS Bulk Carriers), a matter which is, indirectly related to the above one.

1 June 2004
M. Dogliani

Subject: FW: 1060gNVs; WP/SRC - Task 102 - Harmonization of UR Z 7 and Z 7.1

25 May 2005

To: Mr. B. Anne, Chairman of IACS Council,
cc: Council Members, IACS Perm. Sec.

Ref.: My mail NVr dated 20 May 2005

DNV have further studied the amendments to UR Z10.1, Z10.3, and Z10.4, and as a result are presenting the following as a compromise solution:

General comment:
From the comments by other Members it is obvious that there is reluctance to accept annual surveys of ballast tanks with a common plane boundary to heated cargo tanks in the case where the coating is in good condition. This is particularly unreasonable as at the same time we enhance the Intermediate survey of Tankers between 10 and 15 years to also include examination of all ballast tanks, meaning that all ballast tanks will be close up surveyed with 2-3 years intervals from the ship is 10 years old, with the possibility for the surveyor to require thickness measurements and testing of the tanks to ensure the structural integrity of the tanks if necessary.
It is also proposed for the Intermediate survey between 5 and 10 years, to increas the scope from representative to all ballast tanks, a requirement DNV find to strict, and require that we here keep the original text.
If a ballast tank is found to have coating in GOOD condition at the renewal or intermediate survey, a deterioration of the tank beyond structural reliability is very unlikely even if the tank has a common plane boundary to a heated cargo tank.

DNV finds it particularly unreasonable to have this requirement to apply to double hull tankers for the following reasons:
- these ships have double hull and the risk of pollution is here much reduced,
- the double hull is constructed with small spaces giving improved structural reliability,
- almost all double hull tankers below VLLC have heated cargo tanks, and all ballast tanks have common plane boundaries to these tanks, meaning that this requirement will apply to a major part of the tanker fleet in the future,
- the ballast tanks of double hull tankers are so designed that a general examination of these tanks will be identical to a close up survey,
- survey of ballast tanks of double hull tankers will mean either gas freeing of all cargo tanks or at least dropping the inert gas pressure of all cargo tanks in addition to proper airing of all ballast tanks.

Since the single hull tankers will be faced out in the near future, and for clear political reasons, DNV will as a compromise proposal to keep paragraph 2.2.3.1 and 4.2.2.2 in Z 10.1 as amended by Council (ref. IAo) but amend it to not include 2.2.3.1.e, 4.2.2.2.e and last paragraph of 3.2.5.1 in Z10.3 and Z10.4. In addition we request that the original text of 4.2.2.1 is kept.
If BV, ABS and other Members can accept this DNV is willing to drop our reservation presented at C49.
DNV's proposal will then be as follows:

Z10.1:

2.2.3.1: This paragraph can be accepted as is for the reasons stated above.
3.2.5.1: This paragraph is accepted as amended.
4.2.2.2: This paragraph can be accepted as is for reasons stated above.

For other comments to Z10.1 see NVo and NVp.

Z10.3:

2.2.3.1.e to be deleted.
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept."For tanks used for water ballast ---"
4.2.2.2.e to be deleted

Z10.4

2.2.3.1e to be deleted
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept, "For tanks used for water ballast --"
4.2.2.2.e to be deleted.

For details see attached document where the text for the requirements in Z10.3 and Z10.4 that DNV will accept is stated.

Best Regards

Arve Myklebust
on behalf of
Terje Staalstrom
DNV IACS Council Member

Annex 2 to TB (Harmonization Z10s)

WP/SRC Task 114 "Clarify the procedure of verification and signature of the thickness measurement report"

Item No.	Item	ABS	BV[1]	CCS	CRS	DNV	GL	IRS	KR	LR	NK	RINA	RS
1	**Verification onboard**	.											
1.1	Minimum extent of measuring points for direct verification by attending surveyor specified	No	No	No	No	No	No	No	Yes	No	No	Yes	No
1.2	Preliminary TM record to be signed upon completion of the measurements onboard	Yes	Yes [7]	Yes	No (copy taken)	No[3]	No[6]	Yes	Yes	Yes	Yes	No[8]	No
2	**Final TM report**												
2.1	Signature of all pages in TM record required	No	No	No	Yes	No	Yes	Yes	No	No	No[5]	Yes	Yes
2.2	Signature of 'cover' ('general particulars') page only	Yes	Yes	Yes	No	Yes	No	No	No[4]	Yes	Yes	Yes	No
2.3	Measuring points verified by attending surveyor required identified in TM record and signature of the corresponding pages required	No	No	Yes Without signature	Yes	No	No	No	Yes	No	No	No	No

2004-04-20

1) Instructions not clear regarding signature of the thickness measurement record

2) Signature on front and last page, stamp on all other pages, or signature on each page (IACS TM forms)

3) Upon completion of measurements onboard a draft report in electronic format (DNV TM template, including operator's notes as relevant) to be given to attending surveyor

4) Signature of cover page, pages of meeting record and pages of attended measuring points

5) Each page to be signed in case of 'loose-leaf' type record

6) Preliminary TM record has to be passed to the Surveyor, signed by the Operator

7) The only measures which the Surveyors can certify exact are those for which that they have seen the results on the screen of the apparatus. That means in fact few points in comparison with the numbers of recorded measures.

8) The Surveyor reviews the TM record for completeness and assessment of TM readings, but no signature required.

Annex 3: **Technical Background**
(May 2005)

UR Z7s and Z10s (Corrosion Prevention System)

1. Objective:

To clarify whether the survey of anodes is a class matter, and if so, whether acceptance criteria for anode should be developed.

2. Method: GPG by correspondence (5037_)

3. Discussion

3.1 BV initiated GPG discussion as follows:

Paris La Défense, 8 Mars 05

1 - We have noticed that, in the draft UR Z's (7.1, 10.1 to 10.5) issued further to the WP/SRC Task 102, the original sentence "......the examination may be limited to a verification that the hard protective coating remains efficient......" has been replaced by ....that the corrosion prevention system remains efficient....". in a number of paragraphs (such as , for instance, Z 7.1, 4.2.3.1 a) ; Z 10.2 4.2.3.3 ;), in line with IMO Res.A744(18).

2 - However, a corrosion prevention system is defined, in the same UR Z's and in IMO Res.A744(18) , as being either a full hard protective coating or a full hard protective coating supplemented by anodes.

3 - The above would mean that the survey of the anodes is a classification matter.

4 - However, whereas coating conditions are defined as good or fair or poor, there are no criteria in the IACS URs and IMO Res. A744(18) for the anodes condition.

5 - Assessing the anodes condition to confirm that they "remain efficient" looks to BV to be a quite difficult task for the ships in service Surveyor.

6 - Member's view and interpretations on the following would consequently be appreciated:
- do Members consider that the above requirements in IACS URs imply that survey of anodes is part of the classification ?
- do Members consider that the above requirements in IMO Res. A 744 (18) imply that survey of anodes is mandatory?
- if yes, what is the acceptance criteria to conclude that the anodes" remain efficient" ?

3.2 The majority of GPG Members replied that they did not include requirements for anodes in their class rules.

LR / ABS / DNV / KR / NK / RINA / RS were of the view that the condition of any anodes fitted should be recorded for information purposes as the survey of anodes is neither a classification matter nor a mandatory requirement in IMO A.744(18) and has no impact on future surveys (5037_LRa**). [**Note; LR further clarified that “Whilst I agree that the performance of anodes is not normally a class matter LR does require that as part of Special Survey on oil tankers : "The attachment to the structure and condition of anodes in tanks are to be examined ." Therefore we cannot say that 'the survey of anodes is not a classification matter'**. 5037_LRb]**

However, GL said that “for GL, anodes are a matter of class and as such are subject to plan approval as well as surveys. In case of missing or worn-out anodes we issue a condition of class”(5037_GLa&b).

CCS advised that its rules have a general requirement relating to anode survey, which is only conducted, through sampling, during construction, docking survey or where there is a definite requirement for the survey of ballast tanks.

NK proposed that the following footnote be added to Z7s and Z10s:
“The survey of anodes is not a classification matter.” No majority support was achieved.

4. Conclusion

RINA suggested to simply amend the definition of "Corrosion Prevention System" in paragraph 1.2.9 of UR Z7 (and, of course, the paragraphs in all the other UR Zs containing the definition of "Corrosion Prevention System") in order to eliminate any reference to anodes. This proposal would leave room for Societies willing to include additional class requirements for anodes to do so in their Rules.

GPG agreed.

RINA proposed amendments to paragraph 1.2.9 of UR Z7 and corresponding paragraphs in all other UR Zs (5037_RIb, 6 April 2005)

1.2.9 Corrosion Prevention System

A corrosion prevention system is normally considered ~~either:~~ a full hard protective coating.
~~.1 a full hard protective coating, or~~
~~.2 a full hard protective coating supplemented by anodes.~~
Hard protective coating is usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer’s specifications.
Where soft coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

Annex: Council Chair’s conclusive message.

6 May 2005
Permsec

Annex. (5037_ICb, 15 May 2005)

To : All IACS Council Members
c.c : Mr. R. Leslie, IACS Permanent Secretariat

Ref. Mr G-Y. Han's message IAa dated 6 May 05
Message ICa dated 6 May 05
Admiral R.E. Kramek's message ABb dated 13 May 05

Paris La Défense, 15 May 05

1 - All Members have agreed with the texts attached to Mr Han's message.

2 - Further to ABS comments the reference to anodes is to be deleted in Annex I and in tables IX (IV) and IX(II).

3 - further to ABS questions regarding what IACS plan to do regarding IMO and A.744(18) further to IACS deletion of reference to anodes from the UR Z7's and UR Z10's it is to noted that:

The Item 1.2.9 in UR Z1O.1 and relative items in these URs states
1.2.9 10 Corrosion Prevention System: A corrosion prevention system is normally considered either:
.1 a full hard protective coating, or
.2 a full hard protective coating supplemented by anodes.
Hard Pprotective Ccoating is to usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specification.
Where Soft Coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

- therefore the anodes are not considered as the main means of protection against the corrosion It is only a supplement;

- there is no provision in UR Z7's and Z10's to evaluate the level efficiency of the anodes;

- there is no specific requirements in case of lack of efficiency of the anodes.

The experience has shown that ballast tanks only protected by anodes are subject to corrosion when the anodes are becoming less efficient.

The anodes are active only when immersed by sea water. Therefore the upper part of the ballast tanks are not protected when the ballast is full of water and the ballast is not protected when it is empty..

The ships operators are reluctant to replace the anodes especially in upper part which request fitting of scaffolding fo welding the anode supports to the structure.

The above arguments justify the reasons why IACS consider that the anodes are not class item.

4 - These arguments can be used by IACS Members attending the WG bulk carriers at MSC 80 to try to obtain deletion of the reference to anodes in A. 744(18).

Best regards,

Bernard Anne
IACS Council Chairman.

Technical Background

UR Z10.1(Rev.13, Jan 2006)
UR Z10.2(Rev.18, Jan 2006)-separate TB
UR Z10.3(Rev.8, Jan 2006)
UR Z10.4(Rev.3, Jan 2006)
UR Z10.5(Rev.2, Jan 2006)

Part 1. Z10s – para. 1.4 and 7.1.3

Part 2. Z10s – para. 5.5.4 and 5.5.6

Survey Panel Task 22 – Amend applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

Technical Background

Z7(Rev.12)
Z7.1(Rev.3)
Z10.1(Rev.13, para.1.4 & 7.1.3)
Z10.2(Rev.18, para. 1.4 & 7.1.3)
Z10.3(Rev.8, para. 1.4 & 7.1.3)
Z10.4(Rev.3, para. 1.4 & 7.1.3)
Z10.5(Rev.2, para. 1.4 & 7.1.3)

1. **Objective**

To amend the applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

2. **Background**

IACS QC findings, through audits of numerous Societies, which indicated concerns over Surveyor attendance and control of thickness measurement processes.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

To align Close-up survey requirements and thickness measurements in the applicable URZ7s and URZ10s, in accordance with PR19, all Panel members agreed through correspondence and a final vote at the fall Survey Panel meeting, that URZ7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 should include in the applicable sections of the noted URs as proposed by the Survey Panel the wording " In any kind of survey, i.e. special, intermediate, annual, or other surveys having the scope of the foregoing ones, thickness measurements of structures in areas where close-up surveys are required, shall be carried out simultaneously with close-ups surveys."

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Technical Background

UI SC 191 (Rev.2, Oct 2005)

&

UR Z10.1 (Rev.13, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.2 (Rev.18, para. 5.5.4 and 5.5.6, Jan 2006)
UR Z10.3 (Rev.8, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.4 (Rev.3, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.5 (Rev.2, para.5.5.4 and 5.5.6, Jan 2006)

1. Objective

- to confirm whether the guidelines for approval/acceptance of alternative means of access (now REC91, ex Annex to UI SC191) is mandatory or non-mandatory.
- to consider other safety related proposals.

2. Background

The DNV proposal to submit the UI SC191(Rev.1, May 2005, Annex 1) to IMO DE49 triggered a number of discussion points that led to amendments to the following resolutions:

UI SC191(Rev.2)
New REC 91
REC 39(Rev.2)
UR Z10s

Points of Discussion

3. Is the Annex to UI SC191(Rev.1, May '05, guidelines for approval / acceptance of alternative means of access) mandatory or non-mandatory ?

   Answer: Non-mandatory. Hence, re-categorized as new REC 91.

4. Limitation of use of rafts in bulk carrier holds

   DNV proposed that conditions for rafting should be limited to areas, such as anchorage or harbour, where swell conditions are limited to 0.5m. After discussion, GPG approved the ABS' alternative proposal to use the swell condition as a basis to determine the appropriateness of rafting, instead of geographic areas(harbours or anchorage). 5.5.4 of Z10.2 refers.

RINa proposed that para 5.5.4 should be included in all the Z10s. NK's objection is recorded as follows (3037hNKq, 29/08/2005):

> 1. With regard to RIm of 26 August 2005, NK considers that the proposed amendment to 5.5.4 should be limited to UR Z10.2.
>
> 2. Rafting survey for tankers are actually carried out on the open sea from a discharge port to a loading port and in such situation the rise of water within the tanks would always exceed 0.25m. It is different situation from rafting survey for hold frames of bulk carriers normally conducted in a harbour or at an anchorage.
>
> 3. If the same requirement applies to tankers, any rafting survey for cargo oil tanks and ballast tanks of tankers would be prohibited. This is not practicable under present survey procedure for tankers.
>
> 4. Therefore, NK can not support Laura's proposal that the proposed amendment to 5.5.4 of UR Z10.2 is introduced into the other URs and new Recommendation.

For compatibility with the IMO's mandatory requirements*, GPG decided to add the same amendment to all the UR Z10s.

*

- Appendix 4 to MEPC.99(48) ' Mandatory requirements for the Safe Conduct of CAS Surveys'
- MSC.197(80) – amendments to A.744918), Annex A for DSS and SSS bulk carriers and Annex B for single and double hull oil tankers.

As a consequence, 5.5.1 of REC 91(ex Annex to UI SC191) was also amended:

-to remove the reference to dynamic /sloshing (as the 0.25m rise was considered negligible);

-to refer to the rafting conditions contained for cargo holds in Z10.2 and Z10.5 and for oil cargo tanks in Z10.1 and Z10.4.

5. Means of access from longitudinal permanent means of access within each bay to rafts

GPG reviewed the proposal that the following text be added to Z10s:

A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay.

(Technical Background: for the safety of surveyors)

There may be ships which are arranged in accordance with para b, page 8 of the Annex to the current SC 191 (i.e., no means of access from the LPMA in each bay to a raft is required) and therefore could not be rafted if the sentence proposed by RINA("A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay") is included in the Z10's.
GPG therefore agreed not to include this sentence in Z10s.

For the same reason, the same sentence was not added to Rec.39.

Finally, GPG added the following sentence to UI SC191(interpretation for II-1/3-6):

> *A permanent means of access from the longitudinal platform to the water level indicated above is to be fitted in each bay (e.g permanent rungs on one of the deck webs inboard of the longitudinal permanent platform).*

6. Implementation

It was agreed that the revised UI SC191 be implemented to ships contracted for construction 6 months after adoption by Council.

UI SC191 was also edited in line with IMO MSC/Circular. 1176, leaving its mandatory language (is/are to, shall) unchanged.

> (Note: UI SC191(Rev.2) makes references to the following new Recommendations:
> - REC 90: Ship Structure Access Manual
> - REC 91: Guidelines for approval/acceptance of Alternative Means of Access)

23 September 2005
Permanent Secretariat
Updated on 13 Oct 2005.

Survey Panel Task 43 – Amend the applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

Technical Background

(UR Z10.2, Rev.22, June 2006)
(UR Z10.4, Rev.4, June 2006)
(UR Z10.5, Rev.4, June 2006)

1. **Objective**

Amend applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

2. **Background**

Due to the different application of substantial corrosion in the CSR from the current Unified Requirements.

3. **Methodology of Work**

Panel members discussed the proposed revisions through correspondence up to the Spring Panel meeting where final amendments were agreed upon for submittal to the IACS Hull Panel for review.

4. **Discussion**

After much discussion between all Panel members at the March 2006 Survey Panel members, a unanimous decision was reached as to the wording of CSR Substantial corrosion in UR Z10.2, 10.4, and 10.5 in section 1.2.9 and was then submitted to the Hull Panel for review and approval. The hull panel concluded that the Survey Panel definition for CSR substantial corrosion was not entirely accurate and recommended further amendments to clarify the actual requirements. The new definition was then circulated to the Survey Panel for a final review and was unanimously agreed upon.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules/procedures. Assuming that GPG and Council approve the amendments, the Survey Panel would propose **July 2007 as** an implementation date.

Submitted by Survey Panel Chairman

Technical Background

UR Z10.1 (Rev.14), UR Z10.2 (Rev.23), UR Z10.4 (Rev.5) & UR Z10.5 (Rev.5)

Survey Panel Task 3 – Maintenance of Alignment/ Compatibility of IACS URs and IMO survey requirements

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements regarding resolution MSC 197(80) – amendments to A744(18)

2. **Background**

IMO survey requirements to ESP vessels as amended in A744(18) as noted in MSC 197(80), with an implementation date of 1 January 2007.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel members, at the fall 2006 Survey Panel meeting, finalized the amendments to the applicable URs due to changes adopted at MSC(80).
Additionally, Members noted that URZ10.4 paragraphs 2.2.3.1 and 4.2.2.2 does not require examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80). The survey panel agreed that if this is the position that IACS would like to take regarding double hull tankers, then it should be brought to the attention of IMO at the next IMO meeting, DE50 in March 2007.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve the amendments, the Survey Panel would propose January 2008 as an implementation date, although the IMO implementation date is January 2007.

Submitted by Survey Panel Chairman
9 January 2007

GPG discussion

All members agreed to omit the requirement of examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80), from URZ10.4 for double hull tankers and

that it should be brought to the attention of IMO at DE50. In addition ABS proposed that paragraphs relating to similar requirements in URZ10.1 should also be deleted for consistency and this was agreed by members.

Members also made a number of minor/editorial corrections to the text prior to their approval of the revised documents.

Added by Permanent Secretariat
23 April 2007

Technical Background

URs Z7(Rev.15), Z7.1(Rev.5), Z7.2(Rev.1), Z10.1(Rev.15), Z10.2(Rev.26), Z10.3(Rev. 9), Z10.4(Rev.6), Z10.5(Rev.8) – November 2007

Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions

1. Objective

To review IACS Resolutions annually and discuss or propose amendments as deemed necessary.

2. Background

This proposed amendment to all URZ7s and URZ 10s was raised by the Panel member from DNV due to Owners crediting tanks concurrently under intermediate and special survey.

3. Methodology of Work

Survey Panel members through correspondence.

4. Discussion

The Panel member from DNV raised the issue of Owners having the ability of crediting spaces and thickness measurements only once in a 54 month interval, due to the availability of concurrent crediting of spaces and thickness measurements due to the flexible time window that is currently allowed between the intermediate survey and the special survey.
After a presentation and discussion lead by the DNV Panel member, all Survey Panel members agreed to the argument given by DNV, and further agreed to make the necessary changes in all URZ7s and URZ10s where Owners are not allowed to concurrently credit surveys and thickness measurements of spaces.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG approve to the amendments, the Survey Panel would propose January 2009 as an implementation date.

Submitted by Survey Panel Chairman
22 October 2007

Permanent Secretariat note (December 2007):

During GPG discussion DNV proposed that *"since this matter will be discussed between Owner and Class mainly in connection with the forthcoming Special Survey, DNV would prefer to locate this text, not only as part of Intermediate Survey, but also as a new text for the Special Survey."* This was supported by BV, ABS, RINA and KR.

The revised documents were approved, with DNV's proposal and an implementation date of 1 January 2009, on 15 November 2007 (ref. 7690_IGb).

Technical Background

URs Z7(Rev.16), Z7.1(Rev.6), Z7.2(Rev.2), Z10.1(Rev.16), Z10.2(Rev.27), Z10.3(Rev.11), Z10.4(Rev.7) and Z10.5(Rev.9) - March 2009

Survey Panel Task 62:

A) Harmonization of UR Z10.1, Z10.2, Z10.4 and Z10.5 with UR Z10.3 with respect to items 5.5.4.4 and 5.6.2.

B) Harmonization of UR Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 with UR Z7.2 with respect to the definition of the corrosion prevention system and with respect to the footnote 1 related to semi-hard coatings.

C) Harmonization of the definition of Ballast Tank in UR Z7(Rev.14)

1. Objective

A) Amend the texts of items 5.5.4.4 and 5.6.2 in Unified Requirements Z10.1, Z10.2, Z10.4 and Z10.5 in order to align them with those in UR Z10.3, in which they were changed while performing Task 55, whereas in the other UR Z10s they were kept unchanged on the grounds that this change was out of the scope of Task 55.

B) Amend the definition of “Corrosion Prevention System” and include a Footnote 1 related to semi-hard coatings in Unified Requirements Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 in order to align them with those adopted in UR Z7.2, when this new UR was issued.

C) Amend UR Z7 (Rev. 14) in all items where the term “Ballast Tank” is used in order to get them harmonized with the definition itself.

2. Background

The task, as regards item A), was triggered by a Member Society, while performing Task 55, on the grounds that this part was out of the scope of the task and then should have been dealt with in a separate task.
The task, as regards item B), was triggered as a consequence of the “New Business action item 2” of the Minutes of the September 2008 Survey Panel meting, for sake of harmonization of the various URZs.
The task, as regards item C), was triggered as a consequence of the “Task 54-Examination of Double Bottom Ballast Tanks at annual surveys” of the Minutes of March 2008 Survey Panel meeting, for sake of harmonization of the definition of Ballast Tank in UR Z7(Rev.14).

3. Discussion

The task was carried out by correspondence. All the amended texts for the affected URs were prepared by the Survey Panel Member who had chaired the PT on Task 55, in accordance with the Form A approved by GPG. In addition to the objectives outlined in the Form A, an amendment was added to item 1.3.1 of UR Z10.2 and UR Z10.5 in which the reference 3.2.3.6 in the last item of the list was replaced by 3.2.3.10 as can be correctly verified in the text.
The amended URs were circulated to all Survey Panel Members for review, comments and agreement. The texts of the URs were unanimously agreed by all Members.

4. Implementation

The Survey Panel is of the view that the Member Societies need at least 12 months from the adoption date to implement these amendments into their class rules/procedures. Therefore, in the first version of all amended URs the following implementation sentence should be proposed:

Changes introduced in Rev .xx are to be uniformly applied by Member Societies and Associates for surveys commenced on or after [not less than 12 months after the adoption by GPG/Council].

Since it is common practice and convenience to have implementation dates either on 1st January or on 1st July of the year, the Survey Panel proposes the 1st July 2010 as implementation date, if GPG/Council approve the URs not later than 30 June 2009.

Submitted by Survey Panel Chairman
28 February 2009

Permanent Secretariat notes (April 2009):

1. The amended URs were approved by GPG on 18 March 2009 (ref. 7718bIGd).
2. During the typesetting process it was noted that para 5.1.5 of UR 7.2 was inconsistent with the amended URs and so following consultation with the Survey Panel this was also amended at this time.
3. Regarding the implementation date, GPG agreed to use 1st July 2010 provided that it was consistently used for the amended URs.

Technical Background for UR Z10.4 Rev.8, Feb 2010

1. Scope and objectives

To amend UR Z10.4 (Rev.7) for the harmonization with currently revised MARPOL Annex I.

2. Engineering background for technical basis and rationale

None

3. Source / derivation of the proposed IACS Resolution

MARPOL 73/78
IACS UR Z10.4 (Rev.7)

4. Summary of Changes intended for the revised Resolution:

As MARPOL I was revised, the reference to MARPOL I/13 (3) in paragraph 1.2.2bis should read MARPOL I/18(3).

5. Points of discussions or possible discussions

None

6. Attachments if any

None

Technical Background for UR Z10.4 Rev.9 (Mar 2011)

1. Scope and objectives

1) To amend UR Z10.4 to harmonize the definition of transverse section.

2) Update of references in the Executive Hull Summary Table IX.

3) Review IACS URZ10.4 to determine if there are issues which need to be addressed to ensure that the IACS survey regime and the CSRs are compatible.

2. Engineering background for technical basis and rationale

1) Based on that fact that bulk carriers and oil tankers have a transverse framing system applied for example on ship's sides etc. and that UR Z7 is applied to all types of ships and includes an extended definition of transverse section it is necessary to unify this definition in UR Z10s.

2) Update of references in the Executive Hull Summary Table IX such that the introduction of extended annual surveys is noted in the 'Memoranda' section rather than under 'Conditions of Class'.

3) Some requirements in CSRs for Oil Tankers were relevant to ships in operation and it was decided to move them from CSRs to UR 10.4 in more consistent way.

3. Source / derivation of the proposed IACS Resolution

CSRs, IACS UR Z7.
Proposed amendments to UR Z10.4 is based on internal discussion of IACS which is always striving to produce consistent and compatible rule requirements.

4. Summary of Changes intended for the revised Resolution:

1) The following additional text is added to the definition of transverse section in para 1.2.5:

   "For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections."

2) In the Executive Hull Summary Table IX (iv) the reference to part H) is updated to part I) as per Table IX (ii).

3) The main amendment has consisted in removing the requirements found in the CSRs related to surveys after construction and locating them in the applicable sections of UR Z10.4. The rationale of that is to have only one place where survey requirements are given and avoid any duplication of requirements in different documents, which would give rise to problems of maintenance and alignment.

   Other important amendments have been made moving the following items from the CSRs to UR Z10.4 as applicable:

a) the paragraphs regarding the different corrosion patterns, such as pitting corrosion, edge corrosion and grooving corrosion, and their different acceptance criteria,
b) the items regarding the number and locations of thickness measurements, together with the associated table and referenced figures.

Another notable change has been introduced in the "ANNEX II - Recommended Procedures for Thickness Measurements" of UR Z10.4, which, however, are only recommendatory and not mandatory, where thickness measurements forms specific to CSRs double hull oil tankers have been produced in addition to the existing ones, which only apply to non-CSRs ships.

5. Points of discussions or possible discussions

None.

6. Attachments if any

None.

Technical Background for UR Z10.4 Rev.10, July 2011

1. Scope and objectives

Review the requirement for repairs within IACS UR 7 and UR 10 series, in particular the requirement for Prompt and Thorough Repair, with a view to developing wording that would permit a temporary repair and the imposition of a Recommendation/ Condition of Class under specific and controlled circumstances, and in accordance with PR35.

2. Engineering background for technical basis and rationale

There are instances, for example a localised, isolated and very minor hole in a cross-deck strip, at which a suitable temporary repair, for example by welding or doubling, and the imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date, are considered very adequate methodology for dealing with the defect.

Current IACS Requirements in the UR Z7 and Z10 series, for Prompt and Thorough repair, would not permit this to be an option, the defect would have to be permanently Promptly and Thoroughly repaired, which might require removing cargo, moving to a repair berth and staging inner spaces.

Under the Requirements of IACS Procedural Requirement PR 35 the methodology of Temporary Repair and imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date is fully permissible.

3. Source / derivation of the proposed IACS Resolution

Based upon discussion within the IACS Survey Panel.

4. Summary of Changes intended for the revised Resolution:

Following the definition of Prompt and Thorough Repair in the Unified Requirement, a new paragraph is proposed to be added:-

"1.3.3 Where the damage found on structure mentioned in Para. 1.3.1 is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the surveyor to allow an appropriate temporary repair to restore watertight or weather tight integrity and impose a Recommendation/Condition of Class in accordance with IACS PR 35, with a specific time limit."

Also, Table I was split to into 2 tables for enhanced clarity, Table I.1 for Single Skin and Table I.2 for Double skin ships and miscellaneous editorial errors in the Table I.1 and I.2 are corrected.

5. Points of discussions or possible discussions

a) The points of discussion are as indicated in Sections 2 and 4 above.

b) Discussion took place on whether to prepare this amendment as a Unified Interpretation of IMO Resolution A.744(18)/UR Z7 and Z10 series, finally it was agreed to make direct amendment to the relevant URs.
c) It is proposed that this amendment be submitted directly to the IMO DE/MSC Committees for consideration of amending directly IMO Res. A744(18)

6. Attachments if any

None

Technical Background for UR Z10.4 Rev.12, Jan 2014

1. Scope and objectives

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.
b) To align the requirements in PR37 and UR Z10s regarding safe entry to confined spaces.

2. Engineering background for technical basis and rationale

a) As per the IMO Res. A1053 (27), lengthy conversions (not necessarily of major character) or other major repair work can be assigned for a 5 year period from the date of completion of conversion/repairs/surveys.
b) Safety requirements in IACS PR37 can be applied to carry out survey in safe way for all kind of ships. When there are no indications about the safety of surveyor in UR Z10s then the requirements in PR37 shall be applied.

3. Source / derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

a) Following additional text was included to section 2.1.3 to clarify the class period for lengthy conversions

"In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date."

b) Existing Section 5.2.6 and 5.2.7 were deleted from UR Z10s since provisions of these sections were covered by PR37. Reference of PR37 was included in Section 5.2.1.1.

5. Points of discussions or possible discussions

i) Additional text to Para.2.1.3 was discussed in order to clarify class period.
ii) Panel considered that safety of surveyors should be dealt by PR37.

None

Technical Background Document
WP/SRC Task 66
New UR Z10.4 for Double Hull Oil Tankers

Objective and Scope:

To Develop a Unified Requirement for Enhanced Surveys of Double Hull Tankers along the lines of UR Z10.1 but tailored to the structural configuration of double hull tankers and other features which distinguish double hull tankers from single hull tankers and with a view to submitting the outcome to IMO for incorporation in future amendments of A.744(18).

Source of Proposed Requirements:

WP/SRC developed Z10.4 in collaboration with the Permanent Secretariat through correspondence and their meeting. IACS' Post Erika measures have been incorporated in the proposed draft. In addition, Res MSC.105(73) and 108(73) have been introduced into Z10.4 since entry into force date of the aforesaid MSC Resolutions is 1 July 2002.

Points of Discussion:

WP/SRC unanimously agreed to the proposed draft UR Z 10.4 except with respect to 3.2.5.2. The majority of WP/SRC agreed to the proposed text of 3.2.5.2 whereas ABS and NK preferred the corresponding text of Z10.1.

Submitted by the permanent Secretariat

On 11 December 2001

WP/SRC Task 102
HARMONIZATION OF UR Z7s AND Z10s

Technical Background
UR Z7 (Rev. 11)
UR Z7.1 (Rev. 2)
UR Z10.1 (Rev. 12)
UR Z10.2 (Rev. 17)
UR Z10.3 (Rev. 7)
UR Z10.4 (Rev. 2)
UR Z10.5 (Rev. 1)

Contents:

1. Objective

To amend UR Z7s and Z10s in order to make the texts of the above-mentioned URs consistent eliminating all the differences both in substance and in wording (WP/SRC Task 102).

2. Background

In the process of approving UR Z10.4, GPG found it necessary to amend the other existing URs Z10.1, Z10.2, Z10.3, Z10.6 and Z7 in order to eliminate any inconsistencies existing among them.

3. Methodology of work

The WP has progressed its work through many sessions, both during the periodical meetings and dedicated meetings restricted to a Small Group of Members (BV, DNV, GL, LR, RINA) who developed the work in order to be more efficient. All the proposed amendments of the Small Group have regularly been circulated to all Members for comment and agreement.

4. Discussion

4.1 The WP/SRC has completed a comprehensive comparative review of UR Z7 and Z10s, and identified inconsistencies which existed among them. During this review, attention was given to the severity of the requirements applicable to the same spaces/structural areas on different types of ESP ships. As a result, the inconsistencies were eliminated making the URZs harmonized. However, there has been no change to the scope and extent of the survey requirements.

4.2 The starting point for each UR was the most updated version available at the time of commencement. Any revision to the URZs, which were introduced during this task, was taken into account. As for instance, the UR Z10.1 was initially amended based on Rev. 9, while the last amendments are based on Rev. 11 and the UR Z10.2 was initially amended based on Rev. 13, while the last amendments are based on Rev. 16. The proposed revisions of URs Z10.1 and Z10.4 have not been numbered, as there will be revisions to those URs before the revisions introduced by the Task 102 are adopted. In fact, GPG is currently developing a Revision 12 of Z10.1 with the view to introducing significant improvements in the survey regime for ballast tanks (including combined cargo/ballast tanks) of oil tankers and UR Z10s applicable to oil tankers will also have to be revised by incorporating the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005 (see 4.3 below).

4.3 Also, in harmonizing UR Z10.1 and Z10.2 care has been taken to align the corresponding text with that of IMO Res. A.744(18). However, it has been noted that the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005, have not been incorporated into the IACS UR Z10s applicable to oil tankers. It seems that the updating of the above-said UR Z10s will be done by the Perm Sec and reviewed by the WP/SRC Chairman and then circulated for adoption by GPG with concurrence of Council Members for uniform application from 1 January 2005. It is understood that the revisions of the UR Z10s affected by those amendments will not include the changes introduced by the Task 102, as the implementation date proposed for those changes is 1 January 2006 (see below **6. Implementation**).

4.4 In the course of the work the WP has been developing for more than two years, several additional Tasks were assigned to the WP by GPG which affected the development of Task 102. The additional tasks which have been taken into account are the following:

1) In the course of Council discussion on UR Z10.6 (General Cargo Ships), certain inconsistencies were identified between Z10.6 and other Z10s. WP was instructed to expedite Task 102 (1060gIAa, 12 June 2002);
2) WP was instructed to include “Survey Planning for Intermediate Survey” into harmonization work (2108_IAa, 12 July 2002);
3) GPG instructed WP to consider whether Z10.6 should be re-assigned as Z7.1, in connection with the harmonization work. 1060gIAb, 20 Sept 2002.

Z7.1 developed;

4) Partial outcome (Z7 and Z7.1) was submitted to GPG on 17 July 2003(1060g). Council decided that approval of Z7(Rev.10) and Z7.1(Rev.2) is postponed until the harmonization is completed (1060gICb, 6 April 2004);
Council Chairman instructed WP/SRC to Members' comments on the draft revision of UR Z7 and Z7.1 (collected under s/n 1060g, 1060gNKi (30/03/2004) in particular) on 6 April 2004.

5) GPG tasked WP to include the amendments to Z10.2 / Z11 (BCs with hybrid cargo hold arrangements), deleting sheets 15 and 16 for ore carriers, into the harmonized UR Z10s (2212aIGa, 19 Jan 2004);
6) GPG tasked WP to consider whether the requirements relevant to examination of Fuel Oil Tanks in the cargo area at each Special Survey should be put into Z 10s, and internal examination of FOT at Intermediate Survey after SS 2 is needed. (1060gIAf, 30 Jan 2004);
7) GPG tasked WP to harmonize tank testing requirements in Z7s and Z10s. (3006lIAa, 5 April 2004);
8) GPG tasked WP with Task 108 - Develop uniform survey requirements for air vent pipes including the welded connection to deck. Z22 developed. GPG instructed WP to incorporate Z22 into the harmonized Z10s;
9) GPG tasked WP with Task 114 - Verification and signature of TM reports. REC 77(Rev.1) developed and approved on 29 July 2004. Council approved parallel amendments to Z7.1 and Z10s (TM Forms included) and instructed WP to incorporate these into the harmonized Z10s:
    - Recommendation No.77 was revised (Rev.1, July 2004);
    - Z7.1 para.6.3.2 and Z10s para.7.3.2 so amended.
    - "Surveyor's signature" is deleted from all TM Forms in Z10s;
    - A note is added to Annex II(Z10s) declaring that Annex II is recommendatory.

   WP/SRC's investigation into Members' practice in dealing with verification and signature of TM reports is annexed for record keeping purpose. See Annex 2.

10) GPG tasked WP to consider the BV comments on "TM may be dispensed with…." and include the findings into the harmonized Z10s (2219iIAa, 7 April 2004).

5. Agreement within the WP/SRC

All Members have unanimously agreed the attached final versions of UR's.

6. Implementation

WP/SRC is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming Council adoption in December 2004, WP/SRC would propose January 2006 as implementation date.

Annex 1: TB for UR Z10.1(Rev.12, C49 amendments, see Permsec's note 1 below)
Annex 2: WP/SRC Task 114, verification and signature of TM reports(see 9 above).
Annex 3**:** TB for revision of UR Zs concerning "anodes".

Note by the Permanent Secretariat

1. Annex 1 to this TB contains background for amendments to UR Z 10.1(Rev.12) relating to FAIR/POOR/GOOD (C49 amendments). Council at its 49th meeting (June 2004) agreed/decided that comparable changes should be added to Z10.3 and Z10.4.

2. Appendix 3 "TM sampling method" has been added to UR Z10.1 and Z10.4 to keep them consistent with IMO Res.MSC.144(77). The amendments to A.744 contained in MSC.144(77) entered into force on 1 January 2005. *(GPG s/n 4181)*

Under s/n 4072g, paragraph **2.4.6** of UR Z10.1 and **2.4.6** and of UR Z10.4 (paragraph numbering is now harmonized) were amended in order to provide a link between the main text of the UR Z10.1 and 10.4 and the new Annex III Appendix 3 containing the MSC Res.144(77).
Further, it was agreed that the requirements for evaluation of longitudinal strength of the hull girder (as written in MSC.144(77)) should not be required for Intermediate Survey unless deemed necessary by the attending Surveyor. This is covered in 4.2.3.1 and 4.2.4.1 of Z10.1 and Z10.4.

3. GPG agreed that the amended UR Zs should be implemented from 1 July 2006 altogether.

4. DNV's proposed amendments to UR Z10.1, Z10.3 and Z10.4 concerning annual survey of ballast tanks were agreed by Council (1060gICq, 27 June 2005). See Appendix 2 to Annex 1.

5. Annex 3 contains a TB for revision of UR Zs concerning "anodes".

Date: September 2004
Prepared by the WP/SRC

Annex 1 to Technical Background
UR Z 10.1 (Rev.12, C49 amendments(coating-related))

1. Objective

To introduce significant improvements in the survey regime for ballast tanks (including combined/ballast tanks) of oil tankers as matter of strategic concern and urgency to IACS, given the aging of both the single and double hull tanker fleets and the problems encountered with corrosion of ballast tanks in several shipping casualties.

2. Background

Draft amendments to UR Z10.1 were submitted to Council 47 (June 2003) and agreed in principle.

3. Discussion

There was particular concern over accelerated corrosion with age (as the thinner the material, the more rapidly the allowable diminution margin percentage disappears) especially where coatings have broken down. There is also a disincentive for any spend on maintenance of the structure of a ship within a few years of its statutory scrapping date.

Council discussion by correspondence had evolved to the position of substantive proposals – summed as follows (3095_ABa, 2 June 2003):

1. Enhance the Intermediate Survey in Z10.1, Z10.3 and 10.4 for Tankers after 2nd Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey). This corresponds to the latest revision to UR Z10.2.
2. At Annual Survey of ballast tanks with substantial corrosion, the overall survey is to be replaced by close-up survey with thickness measurements of the exposed area.
3. Proposed to task WP/SRC to re-consider the acceptance criteria for the rating FAIR further. For this, eliminate FAIR, leaving only GOOD and POOR redefined as appropriate.
4. Proposed to task WP/SRC to explicitly require close-up survey of Suspect Areas identified at the previous Special Survey.

Council 47 discussed the proposals(June 2003) as follows:

1. Definition of FAIR
   Council 47 agreed that “FAIR” would be retained as a rating and that GPG should instruct WP/SRC to redefine FAIR, so that there would be a clear differences between FAIR, POOR and GOOD. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have the same scope as Special Survey No.2(Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

   Based on the strong majority, Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

   > *DNV and NK stated that they could not accept a requirement for annual surveys of ballast tanks when the coating condition is less*

than GOOD and proposed that GOOD be changed to FAIR (3095_IGc, 30 June 2003)

2. ABS' proposed amendments to Z10.1(annual examination of BWTs in certain conditions) were approved.
3. C 47 agreed that the BWT coating requirements (Z10.1.2.2.3) for intermediate Survey after SS 2 should be the same extent to the previous SS.
4. Given the substance of the changes, the revised Z10.1 should be shown to Industry before adoption.
5. A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.

Following Council 47, the draft text of Z10.1(Rev.12) was distributed to Industry and discussed at the IACS/Industry meeting on 29 August 2003. Industry indicated that UR Z10.1(Rev.12) is acceptable, provided that appropriate IACS guidelines on coating repairs are developed.

The Small Group on Coating (SG/Coating) under WP/SRC prepared draft guidelines on coating repairs and considered the definitions of GOOD / FAIR / POOR. The SG/Coating did not change the definitions and found that the Guidelines provide useful clarifications on the definitions and criteria in achieving an industry wide uniform judgement of coating conditions as well as what is needed to restore GOOD conditions.
Further, an IACS/Industry JWG/Corrosion was established and met in February 2004. The outcome is (3095_IGh, 4 June 2004):
- Draft Guidelines on Coating Repair (IACS REC 87)
- Draft UR Zxx (mandatory coating of cargo tanks on oil tankers)
- Draft UI SC 122 (Rev.2) – mandatory coating of ballast tanks

4. Others

1. Z10.11.2.2bis - Definition of "Combined Cargo/Ballast Tank. …as a routine part of the vessel's operation and will be treated as a Ballast Tank. ...". By so amending, Z10s do not need to repeat "Ballast Tanks *and Combined cargo/salt water Ballast Tanks*" in addressing the ballast tanks. Hence, all the references to "*and Combined cargo/salt water Ballast Tanks"* were deleted.
2. Z10.1.2.2.1.2: The aim of the examination is ~~to be sufficient~~ to discover substantial corrosion…
   Comparable changes are to be added to other UR Zs wherever the same sentence occurs.
3. "IACS Guidelines for Coating Maintenance & Repairs for Ballast Tanks and Combined/Ballast tanks on Oil Tankers" are referenced where relevant.
4. Comparable changes are to be added to UR Z10.3 and Z10.4, after adoption of Z10.1(Rev.12).

Attached: Memo on Coating Matters (GPG Chairman)

9 June 2004
Prepared by the Permsec

Appendix 1 to Annex 1: MEMO on Coating matters

1. Background and discussion within IACS on UR Z10.1 (draft Rev.12) between 29/01/03 and 14/08/03

In view of the survey experience with oil tankers, it was proposed that all ballast tanks should be examined, routinely and uniformly, at annual surveys on ESP tankers exceeding 15 years of age. IACS should amend UR Z10.1 to require the examination of ballast tanks on such ships at each annual survey. This is simple, clear and thorough and not subject to interpretation. (2242_ABq dated 29/1/03)

Then, ABS modified the proposal asking, for tankers subject to URs Z10.1, Z10.3 and Z10.4, exceeding 15 years of age, that the current requirement - pertaining to annual examination of Ballast Tanks adjacent to cargo tanks with any means of heating - be deleted and replaced by a simpler and more stringent requirement that all Ballast Tanks be subject to survey at each subsequent annual survey where either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and the protective coating is not renewed at special survey or intermediate survey. This will ensure that all Ballast Tanks with substantial corrosion or protective coating which is not in GOOD condition at the time of special survey or intermediate survey will be examined at each subsequent annual survey on tankers exceeding 15 years of age. (2242_ABzb dated 14/3/03)
This was later expanded to include all tanks used routinely for ballast water, both ballast-only and cargo/ballast tanks (2242_ABzc dated 14/3/03).

ABS further reviewed the issue of the survey of salt water ballast spaces and combined cargo/salt water ballast spaces with ABS' governing bodies in light of recent casualties and survey findings on other tankers. Their review found an increasing amount of coating breakdown/failure and subsequent rapid wastage in key structures after Special Survey No. 2, i.e. after 10 years of age. These conditions are most prevalent in the under deck structure and the side shell structure in way of the deep loadline. In a number of cases the serious wastage has caused fracturing of the under deck longitudinals and in some cases fracturing has extended to the main deck structure. This led ABS to refine proposed amendments to URs Z10.1, Z10.3 and Z10.4 to require (2242_ABzf dated 9/5/03):

a. For Tankers exceeding 10 years of age

> Salt Water Ballast Spaces and Combined Cargo/Salt Water Ballast Spaces. For tankers exceeding 10 years of age, salt water ballast spaces and combined cargo/salt water ballast spaces are to be internally examined at each subsequent Annual Survey where substantial corrosion is found within the tank or where the protective coating is found to be less than GOOD condition and protective coating is not repaired. Internal examination to be an Overall Survey.

b. For Tankers exceeding 15 years of age:

Salt Water Ballast Spaces and Combined Cargo/Ballast Spaces. For tankers exceeding 15 years of age, salt water ballast spaces and combined cargo/ballast spaces are to be examined internally at each subsequent Annual Survey. Where substantial corrosion is found within the tank, or where the protective coating is found to be in less than GOOD condition and the protective coating is not repaired then in addition to an Overall Survey, under deck structure and the side shell structure in way of the deep loadline is to be subject to Close-up Survey.

NK and BV replied that the proposed amendments made by ABS need to be substantiated in a transparent manner with technical data that ABS may possess and put forward for further assessment and discussion. (2242_NKn dated 14/5/03 and 2242_BVz dated 16/5/03)

DNV (2242_NVn dated 2/6/03), having carefully considered the practical consequences of taking the ship off-hire for gas freeing etc. and being concerned about the difficulties to have these surveys executed in a safe manner and whether the intended safety benefits in implementing the proposed extended scope of the annual survey of Ballast tanks will be met, **proposed the following alternative measures** which would be as effective and may not have such delaying effects to the ship:

1) Enhance the Intermediate Survey in UR Z10.1, 10.3, and 10.4 for Tankers after the 2 Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey. (This will correspond to the latest revised requirements of UR Z10.2 for Bulk Carriers.)
2) At Annual Survey of ballast tanks with substantial corrosion the overall survey should be replaced by close up survey with thickness measurements of the exposed area. (An overall survey of these tanks does not give sufficient information of the development of the areas with substantial corrosion.)
3) Further we will not fail to mention that the WP/SRC has proposed to extend the close up survey in cargo and combination tanks to 30% from the 3 Special / Renewal Surveys.
4) **Experience has shown that the coating condition rating category FAIR has a tendency to be stretched too far into the POOR condition. We will therefore propose that we task the WP/SRC to reconsider the acceptance criteria for the rating FAIR further.**
5) We do also question the need for redefining the definition of combination tanks, particularly since the category I tankers which are the ships that normally are fitted with these type of tanks are to be phased out 2 to 4 years from now. However DNV will not oppose to such a redefinition.

DNV requested Members to consider the above as an alternative to the ABS proposal, bearing in mind that we ought to present this to the industry prior to deciding.

ABS (3095_Aba dated 2/6/03), having further considered its earlier proposals in light of NVn, submitted a revised proposal for consideration by Council at C47 and replied to the above 5 DNV proposals as follows:

1) ABS fully supports this proposal.
2) While ABS agrees with this proposal, it is in fact already provided for in Z7 (3.2.3) and Z10.1 (3.2.5.1)--which require that "Suspect areas (which include any area where substantial corrosion is found) identified at previous Special Survey are to be examined. Areas of substantial corrosion identified at previous special or intermediate survey are to have thickness measurements taken." To us, this implies that close-up survey of these areas is to be done at annual survey in conjunction with the thickness measurements. However, we can

agree to tasking WP/SRC to explicitly require "close-up" survey in this connection and to amend Z7, and all the Z10's, appropriately to make this explicit, if there is majority support for this.

3) We agree that this has been put forward to GPG by WP/SRC via 0237hNVb, 27 May. However, these additional CAS close-up survey requirements do not apply to salt water ballast tanks; only to cargo oil tanks and combined cargo/ballast tanks.
4) **We agree with this assessment and we propose that the only way to eliminate the subjectivity and raise the standard is to eliminate the category "FAIR" completely; leaving only "GOOD" and "POOR" redefined as follows:**
 "GOOD -- condition with no breakdown or rusting or only minor spot rusting.
 POOR -- any condition which is not GOOD condition."
5) ABS does not agree with this proposal. We are particularly concerned that we need a very thorough and robust survey regime for these tankers precisely because they are subject to mandatory phase out over the next several years. We are very concerned that without additional IACS requirements, these tanks will receive little or no inspection and maintenance by owners or others after their last special or intermediate survey, if no substantial corrosion is found at that time. Rapid, localized wastage in way of deteriorating coatings may pose significant hazard if the survey regime is not further tightened as we are proposing.

In conjunction with the above comments on DNV proposals, ABS further considered their previous proposal in ABzf and modified it as follows:

- **ABS simplified the proposal to require annual examination of all salt water Ballast Tanks and combined Cargo/salt water Ballast Tanks irrespective of age, when either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and is not repaired.**
- the requirement for annual (close-up) examination of salt water ballast tanks and combined tanks is already required in Z10.1 (3.2.5.1). ABS proposed adding it to 2.2.3 for clarity and emphasis so that all the conditions which may lead to annual examination of such tanks are listed together in one place.
- Since the principal problem that we are trying to address is rapid, localized corrosion in way of breakdown or deterioration of the protective coating, we are proposing that the coating condition should be found and kept in "GOOD" condition to obviate the need for annual examination. **The attached proposal is made together with the proposals in items 3.1 (intermediate following Special survey 2 to have same scope as prior Special survey) and 3.4 (eliminating "FAIR" and redefining "POOR" as any condition other than "GOOD" condition.**

ABS requested to decide on a course of action at C47 for tightening the survey regime for tankers. They agreed that industry be informed of Council's decisions in this regard prior to IACS making the decision public, but IACS should maintain its independence and take decisive action in this matter. Debate with industry can only lead to delay and to a watering down and compromising of these important requirements.

NK agreed to task WP/SRC to reconsider the acceptance criteria of "FAIR" for clearly define the border between "FAIR" and "POOR" condition. However, **NK strongly opposed the elimination of "FAIR" coating condition from UR Zs** because this can not resolve to remove subjectivity of coating assessment. The three-categorization system of coating condition should be retained. (3095_NKa dated 5/5/03)

<u>Outcome of C47</u>

At **C47**, it was agreed that "Fair" would be retained as a rating and that GPG should instruct WP/SRC to redefine "Fair", so that there would be a clear differentiation between "Fair", "Poor" and "Good". It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have same scope as Special Survey No.2 (Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

Based on strong majority support Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

This matter should be discussed with Industry prior to adoption of any UR by Council.

In a final summary, the Chairman proposed that a constructive dialogue with Industry should take place on the IACS proposal as set out in WP1 plus maintaining 3.2.5.2 modified to say that ballast/combined ballast/cargo tanks will be subject to annual survey when considered necessary by surveyors.

After discussion in the JWG (Industry/IACS), GPG should propose final rules for this matter to Council, including acceptable repair definition.

F**UA 17:** *To instruct WP/SRC to develop guidance on coating repairs and more precise definition of "Fair" coating condition.*

Once approved, these requirements should be incorporated into Z10.3 and Z10.4.

FUA 15

1) *To prepare a draft revision to UR Z10.1 incorporating C 47 decisions:*
   - *The definition of "FAIR" remains as it is;*
   - *ABS proposed amendments to Z10.1 (annual examination of BWTs in certain conditions) were approved;*
   - *C47 agreed that the BWT coating requirements (Z10.1.2.2.3) for Intermediate Survey after Special Survey No.2 should be the same extent to the previous Special Survey.*
   - *Given the substance of the changes, the revised UR Z10.1 should be shown to Industry (OCIMG/Intertanko first among others) before adoption for their review and comments.*
   - *A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.*

2) *GPG Members are to confirm the draft revision to Z10.1 in consultation with their WP/SRC members by correspondence. See 3095_IGa of 13/06/03.*

According to C47 FUA 15, GPG Chairman circulated (3095_IGa dated 13/6/03) draft amendments to UR Z10.1 as agreed in principle at C47.

Having received a number on comments, GPG Chairman (3095_IGb dated 27/6/03) informed that the Council Chairman confirmed that GPG is not to amend the principles agreed at C47, i.e. we are not empowered to change "GOOD" to "FAIR" as proposed by DNV and NK, nor to amend the definitions of "FAIR" and "POOR" as proposed by DNV.

DNV's intention to possibly lodge a reservation was noted, however the matter should be raised at Council and not be dealt with by GPG. An amended draft text incorporating the non-substantive changes proposed by Members was circulated.

DNV said that its understanding was that the draft should be circulated to the Industry (ICS, INTERTANKO, and BIMCO) prior to adoption by Council. (3095_NVc dated 30/6/03)

GPG Chairman (3095_IGc dated 30/6/03) circulated a draft amendment of UR Z10.1 for Council's agreement and use in discussions with the industry associations.
The draft was generally agreed by GPG but individual Members have requested that the following matters (which were deemed to be outside the remit of GPG in this task) be brought to Council's attention for further consideration:

1 DNV and NK stated that they can not accept a requirement for annual surveys of ballast tanks when the coating condition is less than GOOD and propose that GOOD be changed to FAIR.
2 In connection with item 1 above, DNV also propose to amend the definitions of FAIR and POOR in order to raise the standard of FAIR.

Council Chairman (3095_ICb dated 14/8/03) concluded that Council has agreed that the draft amendments to UR Z10.1 attached to IGc reflect Councils' decision taken at C47 and that they be circulated to industry associations.
Perm Sec was therefore invited to submit the draft to OCIMF and INTERTANKO in view of discussion at the IACS/ industry meeting on 29 August.

2. Discussion with Industry (29/08/2003 – 11/10/2003)

As requested by Council, the whole matter was presented to Industry during the "general matters" meeting with IACS held on 29 August 2003; comments from Industry were requested. In the following an extract from the minutes of the meeting (see message 3100aIAb dated 5 September 2003):

__________________________ from Meeting minutes ________________________________

4. & 5. Annual surveys of ballast tanks and IACS guidelines on coating repairs

M. Dogliani introduced the matter (see Items 4&5 in Appendix).

A. LinoCosta gave a presentation to show where concerns and decisions stand: too many cases when coating was considered fair at SS but problems occurred just after one/two years.

N. Mikelis commented on draft amendments to Z10.1 (Rev.11) stating that the extent of annual survey is not clear; it should be limited to the affected zones, e.g. coating breakdowns, only.
M. Guyader clarified that, in this draft amendments, it is expected an overall survey of the whole tank and a close up survey of the affected zones.
N. Mikelis noted that, in the draft amendments to Z10.1 (Rev.11), the intermediate survey at 12.5 years would have the same scope as the previous special survey and that needed a justification. See 7 a).
M. Dogliani said that Z10.1 (Rev.11) was adopted in August 2003 and will be introduced into IACS Societies' Rules over the next year.

Conclusions:
4.1 Industry shared IACS concerns on coatings and, in general, agreed with the draft amendments to Z10.1 (Rev.11) suggesting also extending them to Z10.2 on bulk carriers

4.2 Industry agreed that a guideline for surveyor on coating would greatly improve uniform application of so-amended Z10.1 including issues such as how to consider load bearing elements when judging GOOD/FAIR/POOR status and how to consider bottom pitting in connection with GOOD conditions
4.3 Industry will more precisely comment, by the end of September, the draft Z10.1 so as for IACS to finalise the matter, as planned, for the Council's December meeting.

Item	Title	Industry recommandation	IACS/ M. Dogliani Introduction
4 & 5	Annual survey of ballast tanks IACS guidelines on coating repairs	NN	**1. IACS is considering the following:** - **amend UR Z10.1 (draft circulated to Industry) to the effect that in case at Special Survey or Intermediate Survey the coating in a ballast tank is found less than GOOD, either GOOD conditions are restored or the tank's coating is inspected at each annual survey;** - **develop IACS guideline to assist an uniform application of the so modified (if adopted) UR Z10.1; the guideline should address which repairs are necessary to restore GOOD conditions from FAIR and POOR respectively and which are the criteria for the restored (after repair) situation to be rated as GOOD.**

______________________________ End of extract from minutes ___________________________

INTERTANKO commented (see R. Leslie email to GPG dated 25 September 2003):

- expressing their concern for the draft Z10.1 and underlining

a) targeting: concerns that, if not properly dealt with, Z10.1 would target all ships and not just those which need intervention; the view was expressed that guidelines would probably solve the matter;
b) definition: indicating that the current definitions of GOOD, FAIR and POOR is not clear enough and that the matter would be even worst with GOOD and NON GOOD; again it was indicated that guidelines could solve the matter;
c) expertise: expressing doubts on IACS' surveyors expertise and ability to judge coating conditions; in this respect they (hiddenly) suggest that IACS position is unclear when we say that we are not competent to judge the coating during construction but then we are competent to judge coating during operational life. Even if not explicitly stated, the impression is that also in this case guidelines would help.

Additionaly, INTERTANKO suggested a (quite detailed) set of assessment criteria.

The matter was then finally addressed at the TRIPARTITE Meeting (held in Soul on 29/30 September 2003). There Industry agreed that the way forward was the (joint) development of IACS guidelines (see minutes attached to message 3100_RIe dated 11 October 2003, an extract of which is reproduced below).

______________________________ Extract from the TRIPARTITE minutes ________________

Industry is concerned by the definition of GOOD/NOT GOOD in relation to coating repairs and acceptance criteria. Industry agreed that new guideline on this, which IACS is already producing, was the way forward.

_______________________________ End of the extract from the minutes ___________________

3. Further developments

a) from the above, it was concluded that, provided the guidelines are sound, Industry would accept the concept of Z10.1 (draft) Rev. 12, therefore an IACS team and a JWG were established in order to progress the matter of the guidelines (among other related matters).
b) the team of IACS experts on coating developed draft guidelines and provided recommendations to GPG on the way forward (attached to message 3095bNVc dated 20 November 2003).
c) the guidelines were discussed within the JWG with Industry (see draft minutes circulated within GPG with messages 3095cIGd and 3095cIGe both dated 13 March 2004)
d) further suggestions and comments (as requested at the meeting) were provided by Industry (not circulated to GPG)
e) Bulk Carrier Industry is recommending that similar guidelines are developed in due time also for bulk carriers
f) at DE47 and MSC78, IMO is asking Industry and IACS to develop (compulsory) performance standards for coating of newbuilding (double hull spaces of DSS Bulk Carriers), a matter which is, indirectly related to the above one.

25 May 2005

To: Mr. B. Anne, Chairman of IACS Council,
cc: Council Members, IACS Perm. Sec.

Ref.: My mail NVr dated 20 May 2005

DNV have further studied the amendments to UR Z10.1, Z10.3, and Z10.4, and as a result are presenting the following as a compromise solution:

General comment:
From the comments by other Members it is obvious that there is reluctance to accept annual surveys of ballast tanks with a common plane boundary to heated cargo tanks in the case where the coating is in good condition. This is particularly unreasonable as at the same time we enhance the Intermediate survey of Tankers between 10 and 15 years to also include examination of all ballast tanks, meaning that all ballast tanks will be close up surveyed with 2-3 years intervals from the ship is 10 years old, with the possibility for the surveyor to require thickness measurements and testing of the tanks to ensure the structural integrity of the tanks if necessary.
It is also proposed for the Intermediate survey between 5 and 10 years, to increas the scope from representative to all ballast tanks, a requirement DNV find to strict, and require that we here keep the original text.
If a ballast tank is found to have coating in GOOD condition at the renewal or intermediate survey, a deterioration of the tank beyond structural reliability is very unlikely even if the tank has a common plane boundary to a heated cargo tank.

DNV finds it particularly unreasonable to have this requirement to apply to double hull tankers for the following reasons:
- these ships have double hull and the risk of pollution is here much reduced,
- the double hull is constructed with small spaces giving improved structural reliability,
- almost all double hull tankers below VLLC have heated cargo tanks, and all ballast tanks have common plane boundaries to these tanks, meaning that this requirement will apply to a major part of the tanker fleet in the future,
- the ballast tanks of double hull tankers are so designed that a general examination of these tanks will be identical to a close up survey,
- survey of ballast tanks of double hull tankers will mean either gas freeing of all cargo tanks or at least dropping the inert gas pressure of all cargo tanks in addition to proper airing of all ballast tanks.

Since the single hull tankers will be faced out in the near future, and for clear political reasons, DNV will as a compromise proposal to keep paragraph 2.2.3.1 and 4.2.2.2 in Z 10.1 as amended by Council (ref. IAo) but amend it to not include 2.2.3.1.e, 4.2.2.2.e and last paragraph of 3.2.5.1 in Z10.3 and Z10.4. In addition we request that the original text of 4.2.2.1 is kept.
If BV, ABS and other Members can accept this DNV is willing to drop our reservation presented at C49.
DNV's proposal will then be as follows:

Z10.1:

2.2.3.1: This paragraph can be accepted as is for the reasons stated above.
3.2.5.1: This paragraph is accepted as amended.
4.2.2.2: This paragraph can be accepted as is for reasons stated above.

For other comments to Z10.1 see NVo and NVp.

Z10.3:

2.2.3.1.e to be deleted.
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept."For tanks used for water ballast ---"
4.2.2.2.e to be deleted

Z10.4

2.2.3.1e to be deleted
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept, "For tanks used for water ballast --"
4.2.2.2.e to be deleted.

For details see attached document where the text for the requirements in Z10.3 and Z10.4 that DNV will accept is stated.

Best Regards

Arve Myklebust

Annex 2 to TB (Harmonization Z10s)

WP/SRC Task 114 "Clarify the procedure of verification and signature of the thickness measurement report"

Item No.	Item	ABS	BV[1]	CCS	CRS	DNV	GL	IRS	KR	LR	NK	RINA	RS
1	**Verification onboard**	**.**											
1.1	Minimum extent of measuring points for direct verification by attending surveyor specified	No	No	No	No	No	No	No	Yes	No	No	Yes	No
1.2	Preliminary TM record to be signed upon completion of the measurements onboard	Yes	Yes [7]	Yes	No (copy taken)	No[3]	No[6]	Yes	Yes	Yes	Yes	No[8]	No
2	**Final TM report**												
2.1	Signature of all pages in TM record required	No	No	No	Yes	No	Yes	Yes	No	No	No[5]	Yes	Yes
2.2	Signature of 'cover' ('general particulars') page only	Yes	Yes	Yes	No	Yes	No	No	No[4]	Yes	Yes	Yes	No
2.3	Measuring points verified by attending surveyor required identified in TM record and signature of the corresponding pages required	No	No	Yes Without signature	Yes	No	No	No	Yes	No	No	No	No

2004-04-20

[1] Instructions not clear regarding signature of the thickness measurement record

[2] Signature on front and last page, stamp on all other pages, or signature on each page (IACS TM forms)

[3] Upon completion of measurements onboard a draft report in electronic format (DNV TM template, including operator's notes as relevant) to be given to attending surveyor

[4] Signature of cover page, pages of meeting record and pages of attended measuring points

[5] Each page to be signed in case of 'loose-leaf' type record

[6] Preliminary TM record has to be passed to the Surveyor, signed by the Operator

[7] The only measures which the Surveyors can certify exact are those for which that they have seen the results on the screen of the apparatus. That means in fact few points in comparison with the numbers of recorded measures.

8) The Surveyor reviews the TM record for completeness and assessment of TM readings, but no signature required.

Annex 3: **Technical Background**
(May 2005)

UR Z7s and Z10s (Corrosion Prevention System)

1. Objective:

To clarify whether the survey of anodes is a class matter, and if so, whether acceptance criteria for anode should be developed.

2. Method: GPG by correspondence (5037_)

3. Discussion

3.1 BV initiated GPG discussion as follows:

Paris La Défense, 8 Mars 05

1 - We have noticed that, in the draft UR Z's (7.1, 10.1 to 10.5) issued further to the WP/SRC Task 102, the original sentence "......the examination may be limited to a verification that the hard protective coating remains efficient......" has been replaced by ....that the corrosion prevention system remains efficient....". in a number of paragraphs (such as , for instance, Z 7.1, 4.2.3.1 a) ; Z 10.2 4.2.3.3 ;), in line with IMO Res.A744(18).

2 - However, a corrosion prevention system is defined, in the same UR Z's and in IMO Res.A744(18) , as being either a full hard protective coating or a full hard protective coating supplemented by anodes.

3 - The above would mean that the survey of the anodes is a classification matter.

4 - However, whereas coating conditions are defined as good or fair or poor, there are no criteria in the IACS URs and IMO Res. A744(18) for the anodes condition.

5 - Assessing the anodes condition to confirm that they "remain efficient" looks to BV to be a quite difficult task for the ships in service Surveyor.

6 - Member's view and interpretations on the following would consequently be appreciated:
- do Members consider that the above requirements in IACS URs imply that survey of anodes is part of the classification ?
- do Members consider that the above requirements in IMO Res. A 744 (18) imply that survey of anodes is mandatory?
- if yes, what is the acceptance criteria to conclude that the anodes" remain efficient" ?

3.2 The majority of GPG Members replied that they did not include requirements for anodes in their class rules.

LR / ABS / DNV / KR / NK / RINA / RS were of the view that the condition of any anodes fitted should be recorded for information purposes as the survey of anodes is neither a classification matter nor a mandatory requirement in IMO A.744(18) and has no impact on future surveys (5037_LRa**). [**Note; LR further clarified that “Whilst I agree that the performance of anodes is not normally a class matter LR does require that as part of Special Survey on oil tankers : "The attachment to the structure and condition of anodes in tanks are to be examined ." Therefore we cannot say that 'the survey of anodes is not a classification matter'**. 5037_LRb]**

However, GL said that “for GL, anodes are a matter of class and as such are subject to plan approval as well as surveys. In case of missing or worn-out anodes we issue a condition of class”(5037_GLa&b).

CCS advised that its rules have a general requirement relating to anode survey, which is only conducted, through sampling, during construction, docking survey or where there is a definite requirement for the survey of ballast tanks.

NK proposed that the following footnote be added to Z7s and Z10s:
“The survey of anodes is not a classification matter.” No majority support was achieved.

4. Conclusion

RINA suggested to simply amend the definition of "Corrosion Prevention System" in paragraph 1.2.9 of UR Z7 (and, of course, the paragraphs in all the other UR Zs containing the definition of "Corrosion Prevention System") in order to eliminate any reference to anodes. This proposal would leave room for Societies willing to include additional class requirements for anodes to do so in their Rules.

GPG agreed.

RINA proposed amendments to paragraph 1.2.9 of UR Z7
and corresponding paragraphs in all other UR Zs
(5037_RIb, 6 April 2005)

1.2.9 Corrosion Prevention System

A corrosion prevention system is normally considered ~~either:~~ a full hard protective coating.
~~.1 a full hard protective coating, or~~
~~.2 a full hard protective coating supplemented by anodes.~~
Hard protective coating is usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer’s specifications.
Where soft coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

Annex: Council Chair’s conclusive message.

6 May 2005
Permsec

Annex. (5037_ICb, 15 May 2005)

To : All IACS Council Members
c.c : Mr. R. Leslie, IACS Permanent Secretariat

Ref. Mr G-Y. Han's message IAa dated 6 May 05
Message ICa dated 6 May 05
Admiral R.E. Kramek's message ABb dated 13 May 05

Paris La Défense, 15 May 05

1 - All Members have agreed with the texts attached to Mr Han's message.

2 - Further to ABS comments the reference to anodes is to be deleted in Annex I and in tables IX (IV) and IX(II).

3 - further to ABS questions regarding what IACS plan to do regarding IMO and A.744(18) further to IACS deletion of reference to anodes from the UR Z7's and UR Z10's it is to noted that:

The Item 1.2.9 in UR Z1O.1 and relative items in these URs states
1.2.9 10 Corrosion Prevention System: A corrosion prevention system is normally considered either:
.1 a full hard protective coating, or
.2 a full hard protective coating supplemented by anodes.
Hard Pprotective Ccoating is to usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specification.
Where Soft Coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

- therefore the anodes are not considered as the main means of protection against the corrosion It is only a supplement;

- there is no provision in UR Z7's and Z10's to evaluate the level efficiency of the anodes;

- there is no specific requirements in case of lack of efficiency of the anodes.

The experience has shown that ballast tanks only protected by anodes are subject to corrosion when the anodes are becoming less efficient.

The anodes are active only when immersed by sea water. Therefore the upper part of the ballast tanks are not protected when the ballast is full of water and the ballast is not protected when it is empty..

The ships operators are reluctant to replace the anodes especially in upper part which request fitting of scaffolding fo welding the anode supports to the structure.

The above arguments justify the reasons why IACS consider that the anodes are not class item.

4 - These arguments can be used by IACS Members attending the WG bulk carriers at MSC 80 to try to obtain deletion of the reference to anodes in A. 744(18).

Best regards,

Bernard Anne
IACS Council Chairman.

Technical Background

UR Z10.1(Rev.13, Jan 2006)
UR Z10.2(Rev.18, Jan 2006)-separate TB
UR Z10.3(Rev.8, Jan 2006)
UR Z10.4(Rev.3, Jan 2006)
UR Z10.5(Rev.2, Jan 2006)

Part 1. Z10s – para. 1.4 and 7.1.3

Part 2. Z10s – para. 5.5.4 and 5.5.6

Survey Panel Task 22 – Amend applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

Technical Background

Z7(Rev.12)
Z7.1(Rev.3)
Z10.1(Rev.13, para.1.4 & 7.1.3)
Z10.2(Rev.18, para. 1.4 & 7.1.3)
Z10.3(Rev.8, para. 1.4 & 7.1.3)
Z10.4(Rev.3, para. 1.4 & 7.1.3)
Z10.5(Rev.2, para. 1.4 & 7.1.3)

1. **Objective**

To amend the applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

2. **Background**

IACS QC findings, through audits of numerous Societies, which indicated concerns over Surveyor attendance and control of thickness measurement processes.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

To align Close-up survey requirements and thickness measurements in the applicable URZ7s and URZ10s, in accordance with PR19, all Panel members agreed through correspondence and a final vote at the fall Survey Panel meeting, that URZ7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 should include in the applicable sections of the noted URs as proposed by the Survey Panel the wording " In any kind of survey, i.e. special, intermediate, annual, or other surveys having the scope of the foregoing ones, thickness measurements of structures in areas where close-up surveys are required, shall be carried out simultaneously with close-ups surveys."

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Technical Background

UI SC 191 (Rev.2, Oct 2005)

&

UR Z10.1 (Rev.13, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.2 (Rev.18, para. 5.5.4 and 5.5.6, Jan 2006)
UR Z10.3 (Rev.8, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.4 (Rev.3, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.5 (Rev.2, para.5.5.4 and 5.5.6, Jan 2006)

1. Objective

- to confirm whether the guidelines for approval/acceptance of alternative means of access (now REC91, ex Annex to UI SC191) is mandatory or non-mandatory.
- to consider other safety related proposals.

2. Background

The DNV proposal to submit the UI SC191(Rev.1, May 2005, Annex 1) to IMO DE49 triggered a number of discussion points that led to amendments to the following resolutions:

UI SC191(Rev.2)
New REC 91
REC 39(Rev.2)
UR Z10s

Points of Discussion

3. Is the Annex to UI SC191(Rev.1, May '05, guidelines for approval / acceptance of alternative means of access) mandatory or non-mandatory ?

Answer: Non-mandatory. Hence, re-categorized as new REC 91.

4. Limitation of use of rafts in bulk carrier holds

DNV proposed that conditions for rafting should be limited to areas, such as anchorage or harbour, where swell conditions are limited to 0.5m. After discussion, GPG approved the ABS' alternative proposal to use the swell condition as a basis to determine the appropriateness of rafting, instead of geographic areas(harbours or anchorage). 5.5.4 of Z10.2 refers.

RINa proposed that para 5.5.4 should be included in all the Z10s. NK's objection is recorded as follows (3037hNKq, 29/08/2005):

> 1. With regard to RIm of 26 August 2005, NK considers that the proposed amendment to 5.5.4 should be limited to UR Z10.2.
>
> 2. Rafting survey for tankers are actually carried out on the open sea from a discharge port to a loading port and in such situation the rise of water within the tanks would always exceed 0.25m. It is different situation from rafting survey for hold frames of bulk carriers normally conducted in a harbour or at an anchorage.
>
> 3. If the same requirement applies to tankers, any rafting survey for cargo oil tanks and ballast tanks of tankers would be prohibited. This is not practicable under present survey procedure for tankers.
>
> 4. Therefore, NK can not support Laura's proposal that the proposed amendment to 5.5.4 of UR Z10.2 is introduced into the other URs and new Recommendation.

For compatibility with the IMO's mandatory requirements*, GPG decided to add the same amendment to all the UR Z10s.

*

- Appendix 4 to MEPC.99(48) ' Mandatory requirements for the Safe Conduct of CAS Surveys'
- MSC.197(80) – amendments to A.744918), Annex A for DSS and SSS bulk carriers and Annex B for single and double hull oil tankers.

As a consequence, 5.5.1 of REC 91(ex Annex to UI SC191) was also amended:

-to remove the reference to dynamic /sloshing (as the 0.25m rise was considered negligible);

-to refer to the rafting conditions contained for cargo holds in Z10.2 and Z10.5 and for oil cargo tanks in Z10.1 and Z10.4.

5. Means of access from longitudinal permanent means of access within each bay to rafts

GPG reviewed the proposal that the following text be added to Z10s:

A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay.

(Technical Background: for the safety of surveyors)

There may be ships which are arranged in accordance with para b, page 8 of the Annex to the current SC 191 (i.e., no means of access from the LPMA in each bay to a raft is required) and therefore could not be rafted if the sentence proposed by RINA("A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay") is included in the Z10's.
GPG therefore agreed not to include this sentence in Z10s.

For the same reason, the same sentence was not added to Rec.39.

Finally, GPG added the following sentence to UI SC191(interpretation for II-1/3-6):

> *A permanent means of access from the longitudinal platform to the water level indicated above is to be fitted in each bay (e.g permanent rungs on one of the deck webs inboard of the longitudinal permanent platform).*

6. Implementation

It was agreed that the revised UI SC191 be implemented to ships contracted for construction 6 months after adoption by Council.

UI SC191 was also edited in line with IMO MSC/Circular. 1176, leaving its mandatory language (is/are to, shall) unchanged.

> (Note: UI SC191(Rev.2) makes references to the following new Recommendations:
> - REC 90: Ship Structure Access Manual
> - REC 91: Guidelines for approval/acceptance of Alternative Means of Access)

23 September 2005
Permanent Secretariat
Updated on 13 Oct 2005.

Survey Panel Task 43 – Amend the applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

Technical Background

(UR Z10.2, Rev.22, June 2006)
(UR Z10.4, Rev.4, June 2006)
(UR Z10.5, Rev.4, June 2006)

1. **Objective**

Amend applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

2. **Background**

Due to the different application of substantial corrosion in the CSR from the current Unified Requirements.

3. **Methodology of Work**

Panel members discussed the proposed revisions through correspondence up to the Spring Panel meeting where final amendments were agreed upon for submittal to the IACS Hull Panel for review.

4. **Discussion**

After much discussion between all Panel members at the March 2006 Survey Panel members, a unanimous decision was reached as to the wording of CSR Substantial corrosion in UR Z10.2, 10.4, and 10.5 in section 1.2.9 and was then submitted to the Hull Panel for review and approval. The hull panel concluded that the Survey Panel definition for CSR substantial corrosion was not entirely accurate and recommended further amendments to clarify the actual requirements. The new definition was then circulated to the Survey Panel for a final review and was unanimously agreed upon.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules/procedures. Assuming that GPG and Council approve the amendments, the Survey Panel would propose **July 2007 as** an implementation date.

Submitted by Survey Panel Chairman

Technical Background

UR Z10.1 (Rev.14), UR Z10.2 (Rev.23), UR Z10.4 (Rev.5) & UR Z10.5 (Rev.5)

Survey Panel Task 3 – Maintenance of Alignment/ Compatibility of IACS URs and IMO survey requirements

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements regarding resolution MSC 197(80) – amendments to A744(18)

2. **Background**

IMO survey requirements to ESP vessels as amended in A744(18) as noted in MSC 197(80), with an implementation date of 1 January 2007.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel members, at the fall 2006 Survey Panel meeting, finalized the amendments to the applicable URs due to changes adopted at MSC(80).
Additionally, Members noted that URZ10.4 paragraphs 2.2.3.1 and 4.2.2.2 does not require examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80). The survey panel agreed that if this is the position that IACS would like to take regarding double hull tankers, then it should be brought to the attention of IMO at the next IMO meeting, DE50 in March 2007.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve the amendments, the Survey Panel would propose January 2008 as an implementation date, although the IMO implementation date is January 2007.

Submitted by Survey Panel Chairman
9 January 2007

GPG discussion

All members agreed to omit the requirement of examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80), from URZ10.4 for double hull tankers and

that it should be brought to the attention of IMO at DE50. In addition ABS proposed that paragraphs relating to similar requirements in URZ10.1 should also be deleted for consistency and this was agreed by members.

Members also made a number of minor/editorial corrections to the text prior to their approval of the revised documents.

Added by Permanent Secretariat
23 April 2007

Technical Background

URs Z7(Rev.15), Z7.1(Rev.5), Z7.2(Rev.1), Z10.1(Rev.15), Z10.2(Rev.26), Z10.3(Rev. 9), Z10.4(Rev.6), Z10.5(Rev.8) – November 2007

Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions

1. Objective

To review IACS Resolutions annually and discuss or propose amendments as deemed necessary.

2. Background

This proposed amendment to all URZ7s and URZ 10s was raised by the Panel member from DNV due to Owners crediting tanks concurrently under intermediate and special survey.

3. Methodology of Work

Survey Panel members through correspondence.

4. Discussion

The Panel member from DNV raised the issue of Owners having the ability of crediting spaces and thickness measurements only once in a 54 month interval, due to the availability of concurrent crediting of spaces and thickness measurements due to the flexible time window that is currently allowed between the intermediate survey and the special survey.
After a presentation and discussion lead by the DNV Panel member, all Survey Panel members agreed to the argument given by DNV, and further agreed to make the necessary changes in all URZ7s and URZ10s where Owners are not allowed to concurrently credit surveys and thickness measurements of spaces.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG approve to the amendments, the Survey Panel would propose January 2009 as an implementation date.

Submitted by Survey Panel Chairman
22 October 2007

Permanent Secretariat note (December 2007):

During GPG discussion DNV proposed that *"since this matter will be discussed between Owner and Class mainly in connection with the forthcoming Special Survey, DNV would prefer to locate this text, not only as part of Intermediate Survey, but also as a new text for the Special Survey."* This was supported by BV, ABS, RINA and KR.

The revised documents were approved, with DNV's proposal and an implementation date of 1 January 2009, on 15 November 2007 (ref. 7690_IGb).

Technical Background

URs Z7(Rev.16), Z7.1(Rev.6), Z7.2(Rev.2), Z10.1(Rev.16), Z10.2(Rev.27), Z10.3(Rev.11), Z10.4(Rev.7) and Z10.5(Rev.9) - March 2009

Survey Panel Task 62:

A) ***Harmonization of UR Z10.1, Z10.2, Z10.4 and Z10.5 with UR Z10.3 with respect to items 5.5.4.4 and 5.6.2.***
B) ***Harmonization of UR Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 with UR Z7.2 with respect to the definition of the corrosion prevention system and with respect to the footnote 1 related to semi-hard coatings.***
C) ***Harmonization of the definition of Ballast Tank in UR Z7(Rev.14)***

1. Objective

A) Amend the texts of items 5.5.4.4 and 5.6.2 in Unified Requirements Z10.1, Z10.2, Z10.4 and Z10.5 in order to align them with those in UR Z10.3, in which they were changed while performing Task 55, whereas in the other UR Z10s they were kept unchanged on the grounds that this change was out of the scope of Task 55.
B) Amend the definition of “Corrosion Prevention System” and include a Footnote 1 related to semi-hard coatings in Unified Requirements Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 in order to align them with those adopted in UR Z7.2, when this new UR was issued.
C) Amend UR Z7 (Rev. 14) in all items where the term “Ballast Tank” is used in order to get them harmonized with the definition itself.

2. Background

The task, as regards item A), was triggered by a Member Society, while performing Task 55, on the grounds that this part was out of the scope of the task and then should have been dealt with in a separate task.
The task, as regards item B), was triggered as a consequence of the “New Business action item 2” of the Minutes of the September 2008 Survey Panel meting, for sake of harmonization of the various URZs.
The task, as regards item C), was triggered as a consequence of the “Task 54-Examination of Double Bottom Ballast Tanks at annual surveys” of the Minutes of March 2008 Survey Panel meeting, for sake of harmonization of the definition of Ballast Tank in UR Z7(Rev.14).

3. Discussion

The task was carried out by correspondence. All the amended texts for the affected URs were prepared by the Survey Panel Member who had chaired the PT on Task 55, in accordance with the Form A approved by GPG. In addition to the objectives outlined in the Form A, an amendment was added to item 1.3.1 of UR Z10.2 and UR Z10.5 in which the reference 3.2.3.6 in the last item of the list was replaced by 3.2.3.10 as can be correctly verified in the text.
The amended URs were circulated to all Survey Panel Members for review, comments and agreement. The texts of the URs were unanimously agreed by all Members.

4. Implementation

The Survey Panel is of the view that the Member Societies need at least 12 months from the adoption date to implement these amendments into their class rules/procedures. Therefore, in the first version of all amended URs the following implementation sentence should be proposed:

Changes introduced in Rev .xx are to be uniformly applied by Member Societies and Associates for surveys commenced on or after [not less than 12 months after the adoption by GPG/Council].

Since it is common practice and convenience to have implementation dates either on 1st January or on 1st July of the year, the Survey Panel proposes the 1st July 2010 as implementation date, if GPG/Council approve the URs not later than 30 June 2009.

Submitted by Survey Panel Chairman
28 February 2009

Permanent Secretariat notes (April 2009):

1. The amended URs were approved by GPG on 18 March 2009 (ref. 7718bIGd).
2. During the typesetting process it was noted that para 5.1.5 of UR 7.2 was inconsistent with the amended URs and so following consultation with the Survey Panel this was also amended at this time.
3. Regarding the implementation date, GPG agreed to use 1st July 2010 provided that it was consistently used for the amended URs.

Technical Background for UR Z10.4 Rev.8, Feb 2010

1. Scope and objectives

To amend UR Z10.4 (Rev.7) for the harmonization with currently revised MARPOL Annex I.

2. Engineering background for technical basis and rationale

None

3. Source / derivation of the proposed IACS Resolution

MARPOL 73/78
IACS UR Z10.4 (Rev.7)

4. Summary of Changes intended for the revised Resolution:

As MARPOL I was revised, the reference to MARPOL I/13 (3) in paragraph 1.2.2bis should read MARPOL I/18(3).

5. Points of discussions or possible discussions

None

6. Attachments if any

None

Technical Background for UR Z10.4 Rev.9 (Mar 2011)

1. Scope and objectives

1) To amend UR Z10.4 to harmonize the definition of transverse section.

2) Update of references in the Executive Hull Summary Table IX.

3) Review IACS URZ10.4 to determine if there are issues which need to be addressed to ensure that the IACS survey regime and the CSRs are compatible.

2. Engineering background for technical basis and rationale

1) Based on that fact that bulk carriers and oil tankers have a transverse framing system applied for example on ship's sides etc. and that UR Z7 is applied to all types of ships and includes an extended definition of transverse section it is necessary to unify this definition in UR Z10s.

2) Update of references in the Executive Hull Summary Table IX such that the introduction of extended annual surveys is noted in the 'Memoranda' section rather than under 'Conditions of Class'.

3) Some requirements in CSRs for Oil Tankers were relevant to ships in operation and it was decided to move them from CSRs to UR 10.4 in more consistent way.

3. Source / derivation of the proposed IACS Resolution

CSRs, IACS UR Z7.
Proposed amendments to UR Z10.4 is based on internal discussion of IACS which is always striving to produce consistent and compatible rule requirements.

4. Summary of Changes intended for the revised Resolution:

1) The following additional text is added to the definition of transverse section in para 1.2.5:

   "For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections."

2) In the Executive Hull Summary Table IX (iv) the reference to part H) is updated to part I) as per Table IX (ii).

3) The main amendment has consisted in removing the requirements found in the CSRs related to surveys after construction and locating them in the applicable sections of UR Z10.4. The rationale of that is to have only one place where survey requirements are given and avoid any duplication of requirements in different documents, which would give rise to problems of maintenance and alignment.

   Other important amendments have been made moving the following items from the CSRs to UR Z10.4 as applicable:

a) the paragraphs regarding the different corrosion patterns, such as pitting corrosion, edge corrosion and grooving corrosion, and their different acceptance criteria,
b) the items regarding the number and locations of thickness measurements, together with the associated table and referenced figures.

Another notable change has been introduced in the "ANNEX II - Recommended Procedures for Thickness Measurements" of UR Z10.4, which, however, are only recommendatory and not mandatory, where thickness measurements forms specific to CSRs double hull oil tankers have been produced in addition to the existing ones, which only apply to non-CSRs ships.

5. Points of discussions or possible discussions

None.

6. Attachments if any

None.

Technical Background for UR Z10.4 Rev.10, July 2011

1. Scope and objectives

Review the requirement for repairs within IACS UR 7 and UR 10 series, in particular the requirement for Prompt and Thorough Repair, with a view to developing wording that would permit a temporary repair and the imposition of a Recommendation/ Condition of Class under specific and controlled circumstances, and in accordance with PR35.

2. Engineering background for technical basis and rationale

There are instances, for example a localised, isolated and very minor hole in a cross-deck strip, at which a suitable temporary repair, for example by welding or doubling, and the imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date, are considered very adequate methodology for dealing with the defect.

Current IACS Requirements in the UR Z7 and Z10 series, for Prompt and Thorough repair, would not permit this to be an option, the defect would have to be permanently Promptly and Thoroughly repaired, which might require removing cargo, moving to a repair berth and staging inner spaces.

Under the Requirements of IACS Procedural Requirement PR 35 the methodology of Temporary Repair and imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date is fully permissible.

3. Source / derivation of the proposed IACS Resolution

Based upon discussion within the IACS Survey Panel.

4. Summary of Changes intended for the revised Resolution:

Following the definition of Prompt and Thorough Repair in the Unified Requirement, a new paragraph is proposed to be added:-

"1.3.3 Where the damage found on structure mentioned in Para. 1.3.1 is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the surveyor to allow an appropriate temporary repair to restore watertight or weather tight integrity and impose a Recommendation/Condition of Class in accordance with IACS PR 35, with a specific time limit."

Also, Table I was split to into 2 tables for enhanced clarity, Table I.1 for Single Skin and Table I.2 for Double skin ships and miscellaneous editorial errors in the Table I.1 and I.2 are corrected.

5. Points of discussions or possible discussions

a) The points of discussion are as indicated in Sections 2 and 4 above.

b) Discussion took place on whether to prepare this amendment as a Unified Interpretation of IMO Resolution A.744(18)/UR Z7 and Z10 series, finally it was agreed to make direct amendment to the relevant URs.
c) It is proposed that this amendment be submitted directly to the IMO DE/MSC Committees for consideration of amending directly IMO Res. A744(18)

6. Attachments if any

None

Technical Background for UR Z10.4 Rev.12, Jan 2014

1. Scope and objectives

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.
b) To align the requirements in PR37 and UR Z10s regarding safe entry to confined spaces.

2. Engineering background for technical basis and rationale

a) As per the IMO Res. A1053 (27), lengthy conversions (not necessarily of major character) or other major repair work can be assigned for a 5 year period from the date of completion of conversion/repairs/surveys.
b) Safety requirements in IACS PR37 can be applied to carry out survey in safe way for all kind of ships. When there are no indications about the safety of surveyor in UR Z10s then the requirements in PR37 shall be applied.

3. Source/derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

a) Following additional text was included to section 2.1.3 to clarify the class period for lengthy conversions

"In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date."

b) Existing Section 5.2.6 and 5.2.7 were deleted from UR Z10s since provisions of these sections were covered by PR37. Reference of PR37 was included in Section 5.2.1.1.

5. Points of discussions or possible discussions

i) Additional text to Para.2.1.3 was discussed in order to clarify class period.
ii) Panel considered that safety of surveyors should be dealt by PR37.

Rev.4 (Jun 2006)	23 June 2006	1 July 2007
Rev.3 (Jan 2006)	31 January 2006	1 January 2007
Rev.2 (Jan 2006)	4 January 2006	1 January 2007
Rev.1 (Jun 2005)	27 June 2005	1 July 2006
Corr.1 (Jan 2004)	26 January 2004	
NEW (Dec 2003)	10 December 2003	1 January 2005

**** Notes:***

1. *Changes introduced in Rev.5 are to be uniformly implemented for surveys commenced on or after 1 January 2008, whereas statutory requirements of IMO Res. MSC 197(80) apply on 1 January 2007.*
2. *The changes to section 6 introduced in Rev.11 are to be uniformly applied by IACS Societies for surveys commenced on or after 1 July 2016.*
   The other changes introduced in Rev.11 are to be uniformly applied by IACS Societies for surveys commenced on or after 1 July 2014.

- **Rev. 20 (Feb 2023)**

.1 Origin of Change:

- Suggestion by an IACS member
- Based on IMO Regulation

.2 Main Reason for Change:

To revise the definition of Ballast tank from use of 'solely' carriage of salt water to 'primarily' use in line with other IACS URs and ESP Code.

To revise the criteria for annual examination of ballast tanks from POOR condition to condition less than GOOD in line with the amendments made to ESP Code vide Res.MSC.525(106).

To insert a new requirement for annual examination of double-side skin void spaces, for bulk carriers exceeding 20 years of age and of 150 m in length and upwards, as a consequence of the results of the renewal survey and intermediate survey in line with the amendments made to ESP Code vide Res.MSC.525(106).

To refine the wording of ballast tanks examination requirements at annual surveys in line with the amendments made to ESP Code vide Res.MSC.525(106).

To insert the Owners Inspection Report to make in line with other IACS URs.

To revise a reference changed to IACS Recommendation in line with other IACS URs and the amendments made to ESP Code vide Res.MSC.525(106).

.3 List of non-IACS Member classification societies contributing and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

- One survey panel member pointed out the definition of ballast tank in UR 10s are different from other URs like UR7/7.1/7.2 and the ESP Code, so panel decided to modify the wording 'solely' to 'primary'. (PSU20004)

- Enhancement of ballast tank examination for bulk carriers, that increase the criteria of annual examination from 'POOR' condition to the condition less than 'GOOD', was submitted to SDC8. Although IACS has objected to the view and submitted commenting papers continuously, the proposal was agreed at SDC8 and published as Res.MSC.525(106).

- One another new requirement, examination of double-side skin void spaces, for bulk carriers exceeding 20 years of age and of 150 m in length and upwards, at annual survey when required as a consequence of the results of the renewal survey and intermediate survey was proposed to SDC8. Although IACS continuously objected the proposal, it was agreed at SDC8 and published as Res.MSC.525(106).

- One survey panel member suggested to refine the wording 'extended annual/intermediate survey' to 'examination of ballast tanks at annual surveys' in Executive Hull Summary and panel decided to modify it in the ESP Code first. It was submitted to SDC8 and included in Res.MSC.525(106). (PSU18056)

- One survey panel member pointed out that the Owners Inspection Report, that is included in UR Z10.1, 10.2, and 10.4, is not included in UR Z10.5, and all members agreed to insert it as a table III. (PSU20013)

- One survey panel member pointed out that the references in UR Z10s need to updated (referred documents have been changed to IACS Recommendations) and deleted to be in line with other UR Z10s. And panel decided to delete the reference of itself in UR Z10.2 in line with the amendments made to ESP Code vide Res.MSC.525(106). (PSU19057)

No TB is expected for the present revision.

.5 Other Resolutions Changes:

Unified Requirements: Z10.2, Z10.4 and Z10.5

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal:	28 January 2020	(PSU20004)
	24 October 2017	(PSU18056)
	18 December 2019	(PSU19057)
	16 March 2020	(PSU20013)
Panel Approval:	12 October 2021	(PSU21026_ISUf)
GPG Approval:	08 February 2023	(22198_IGd)

- **Rev. 19 (May 2019)**

.1 Origin of Change:

  - o Suggestion by an IACS member

.2 Main Reason for Change:

This revision is to address the policy decision made by GPG using the common terminology 'Condition of Class'(CoC) instead of the terms 'Recommendation/ Condition of Class' based on the outcome of III 5.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

During the 29th panel meeting, the panel discussed about the comments of members, and concurred with the view to retain the present definitions of CoC in the IACS resolutions with the wording 'Recommendation' to be removed. The panel also agreed to use the term 'Statutory Condition' for the 'recommendation' of the statutory certificates in IACS resolutions and RECs, and when discussing the proposal of a member to consider the harmonization of the terms of 'recommendation' and 'condition of class' in RO Code, the panel unanimously agreed to take no action on the IMO instruments, leaving the relevant actions to be decided by the relevant IMO bodies when IACS feeds back to IMO the IACS action on the harmonization of the two terms.

Panel members concurred with the view that it is not necessary to develop a new procedure requirement, and agreed to set the implementation date of these IACS resolutions (other than RECs) as 1st July 2020.

Before the implementation date of 1st July 2020 for using the common terminology 'Condition of Class' only, 'Recommendations' and 'Condition of Class' are to be read as being different terms used by Societies for the same thing, i.e. requirements to the effect that specific measures, repairs, surveys etc. are to be carried out within a specific time limit in order to retain Classification.

No TB is expected for the present revision.

.5 Other Resolutions Changes:

The following IACS resolutions and Recommendations (RECs) were agreed to be revised:

- Procedural Requirements: PR1A, PR1B, PR1C, PR1D, PR1 Annex, PR3, PR12, PR20, PR35 and the attachment of PR16;
- Unified Requirements: Z7, Z7.1, Z7.2, Z10.1, Z10.2, Z10.3, Z10.4, Z10.5, Z15 and Z20
- Unified Interpretations: GC13
- Recommendations: Rec.41, Rec.75, Rec.96, Rec.98

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal: 14 January 2019 tasked by GPG (17044bIGm)
Panel Approval: 22 March 2019 (PSU19010)
GPG Approval: 30 May 2019 (17044bIGu)

- **Rev.18 (Jan 2018)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reasons for Change:

In order to introduce new provisions into the ESP Code which were found among the ESP Code and relevant URZ10s, a series of items of UR Z10s shall be amended accordingly with ESP Code.

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Panel members discussed this issue under PSU17018: updating the CSR reference for both HCSR and CSR for Bulk Carriers; "Thickness measurement company" was to be replaced with "Thickness measurement firm" throughout the UR; some paragraphs were to be revised for consisting with ESP Code; etc.

During the 26th Survey Panel Meeting, the Panel discussed the divergence and reached agreements with the revisions.

No TB is expected for the present revision.

.5 Other Resolutions Changes

UR Z10.1, UR Z10.2, UR Z10.3, UR Z10.4

.6 Dates:

Original Proposal: 22 October 2016 by a Survey Panel Member
Panel Approval: 24 December 2017 by Survey Panel (Ref: PSU17018)
GPG Approval: 15 January 2018 (Ref:17189_IGc)

- **Rev.17 (Sep 2017)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reasons for Change:

To introduce the criteria for the steel renewal which belongs under the unified requirements of series S and are related to the net scantling approach

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

A member noted that some Unified Requirements of series S (Strength of Ships), such as UR S18, contain criteria addressing the steel renewal for dedicated structures such as transverse bulkheads, cargo hatch coamings and plating. These criteria (based on the net scantling approach) are applicable also to units designed with the gross scantling approach because they refers to particular structures for which it is foresaw the dimensioning (or the design verification) according to the net scantling approach.

During the 24th Survey Panel Meeting the members agreed to review all UR of the S series in order to identify those containing any steel renewal criteria with the scope to review them.

Having found that UR S18, UR S19 and UR S21 contain steel renewal criteria that need to be taken in to account during the thickness measurements review process, the members agreed that a new paragraph dealing with this issue needed to be added under section 8 of UR Z10.5.

The paragraph 8.1.2 "Thickness measurements Acceptance Criteria", has been agreed and inserted in the present revision of UR Z10.5.

No TB is expected for the present revision.

.5 Other Resolutions Changes

UR Z7, UR Z7.1, UR Z10.2

.6 Dates:

Original Proposal: 09 September 2016 (24th Survey Panel meeting)
Made by a Survey Panel Member
Panel Approval: 25 August 2017 (Ref: PSU16044)
GPG Approval: 26 September 2017 (Ref: 17107aIGb)

- **Rev.16 (Nov 2016)**

.1 Origin of Change:

☑ Suggestion by IACS members

.2 Main Reasons for Change:
To address the Observation 04, raised by the IMO Auditing Team 5 of the IACS common package 1 in respect to the functional requirements (FR) 9-15.

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Based upon a GPG Member's proposal, the Panel examined, under the task PSU16017, the possible modification of the UR Z10.2 in order to include the verification of the Ship Construction File (SCF) during the class periodical surveys for those ships subjected to the requirements of SOLAS reg. II-1/3-10.
The suggested text was discussed by the Members and it was agreed that since the issue might be regarded as a proactive extension of the corrective action to OBS 04 this should be inserted under paragraph 6.4.2 of UR Z10.2.
Members reviewed the proposed text together with the relevant proposals of its modification; during the 24th Survey Panel meeting agreed to add the new paragraphs 6.4.2.1 and 6.4.2.2 dealing with the verifications of the Ship Construction File to be performed during the periodical surveys.

No technical background is expected for this revision.

.5 Other Resolutions Changes

The amendment affects UR Z10.2 and UR Z 10.4.

.6 Dates:

Panel Approval: 09 September 2016 - 24th Survey Panel Meeting
GPG Approval: 22 November 2016 (Ref: 16077_IGd)

- **Rev.15 (Feb 2015)**

.1 Origin of Change:

☑ Suggestions by IACS members

.2 Main Reasons for Change:

a) Consider appropriate text in IACS document regarding the applicability of the Thickness Measurements when the Close up survey is performed.
b) Modification of Table II MINIMUM REQUIREMENTS FOR THICKNESS MEASUREMENTS AT SPECIAL SURVEY FOR DOUBLE SKIN BULK CARRIERS
c) To consider the impracticability of the internal structure close up inspection of cargo hold hatch covers which have no access structurally (from the approved design) and it is possible to survey and gauge plating only.
d) To consider that some double skin bulk carriers are of longitudinal construction instead that of transversal construction.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) Following an ACB query an IACS member proposed to add suitable text in appropriate IACS documents regarding the application of the Thickness Measurements when the close up surveys are performed as survey requirement due at the Intermediate/ Renewal Class surveys. This Member expressed the view that the requirements to execute the Thickness Measurements of the area subject to Close Up Surveys are expected into the table relevant to "MINIMUM REQUIREMENTS FOR THICKNESS MEASUREMENTS AT SPECIAL SURVEY ………" while the paragraph 1.4 of the document contains only the requirement that "Thickness Measurements of the areas subject to close up surveys shall be taken in conjunction with the close up survey".

   Panel discussed the matter under item PSU13051 and considered that wordings of Para 1.4 of current UR Z7s/10s need to be revised in order to clarify the issue. Considering also item b) finally Panel agreed

b) An IACS member noted that table II relevant to "MINIMUM REQUIREMENTS FOR THICKNESS MEASUREMENTS AT SPECIAL SURVEY FOR DOUBLE SKIN BULK CARRIERS" did not recalled correctly the tables of the close up surveys. In fact the table II was recalling generically table I while it should be necessary specify table I/Sheet 1 table I/Sheet 2 as applicable, being two separate tables for Double Skin Bulk Carriers and Ore Carriers in the UR Z10.5. According to the highlight, Member proposed the modification of table II of UR Z10.5

c) Panel, following the proposal submitted by a Member, concurred and agreed that in case the cargo hold hatch covers have a configuration that does not permit the ingress of the surveyor for the internal inspection (e.g. box type panel), the close up survey should be limited to external parts as well as the Thickness Measurements that should be performed only on the external plating. The technical background, on which is based the modification of the requirement, is that the internal structure of a hatch cover of box type construction are reasonably not subject to any corrosion phenomenon. Hence, unless the external plating of the box is damaged, no depletion of the internal structures is expectable.

Panel discussed the matter under item PSU13051 and considered that an explanation note to Para 2.2.4.1 and to Table 1 of current UR Z10.2 and UR Z10.5 need to be added to clarify this issue.

1) to add additional wording to Para.1.4;
2) to modify table II of UR Z10.5
3) to add a note, relevant to the inspection of the cargo hold hatch covers, to para 2.2.4.1 and to table I (Sheet 1 and Sheet 2).

d) Panel, under task PSU14004) considered the issue relevant the possibility that the ordinary framing of a double skin bulk carrier may be also of longitudinal construction. Panel agreed to modify in consistency the close up survey requirements for double skin spaces in Table I/Sheet I: Moreover, in relation to this modification Panel agreed to remove the wording "web" so that instead to read "transverse web frames" it will read "transverse frames". According to the outcomes of the discussions Members noted inconsistencies in the following figures, showing the places were measurements have to be taken (figures no. 4, 6, 7 and 8) because they showed only the cases of a transversally framed double skin. Modified figures have been inserted (figures no 4, 6, 7 and 8) and the new figure 11(b), relevant to the close up area of a longitudinally framed double skin, has been inserted.

.5 Other Resolutions Changes

1. The identical amendment a) affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.2, UR Z10.3 and UR Z10.4.
2. The amendment c) affects also Ur Z7.1 and UR Z 10.2.

.6 Dates:

Panel Approval: Amendment a) at 19th Survey Panel Meeting (6 March 2014)
Amendment b) and c) by correspondence under PSU 13051
Amendment d by correspondence under PSU 14004

GPG Approval: 05 February 2015 (Ref: 14193_IGc)

- **Rev. 14 (Jan 2014)**

.1 Origin of Change:

☑ Suggestion by IACS members
☑ Suggestion by GPG

.2 Main Reasons for Change:

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.

b) To align the difference between PR37 and URZ's regarding safe entry to confined spaces.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) With reference to IMO Res. A1053 (27) (5.5 Application of "special circumstances") an IACS member proposed to add suitable text in appropriate IACS document regarding class period for lengthy conversions. This Member expressed that when a renewal survey has been completed, the new 5 year class period would normally be calculated from the expiry of previous class period/class certificate and in some cases this might result in unreasonably short time from one renewal survey completion until the next renewal would be due.

   Panel discussed and considered that wordings of Para 2.1.3 of current UR Z7s/10s (second sentence) could address this issue but finally agreed to add additional text to Para 2.1.3 in order to clarify this matter.(PSU 13024)

b) Panel discussed to clarify the survey requirements in PR37 and URZ's regarding safe entry to confined spaces. Panel considered that the safety issues of surveyor should be dealt by PR37. At 18th Panel meeting, Panel concluded to delete requirements from UR Z10s which were already covered by the PR37.

.5 Other Resolutions Changes

a) The identical amendment affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.2, UR Z10.3 and UR Z 10.4.
b) The identical amendment affects UR Z10.1, UR Z10.2, UR Z10.3 and UR Z 10.4.

.6 Dates:

Panel Approval: 7 November 2013 by Survey Panel
GPG Approval: 14 January 2014 (Ref: 12011aIGd)

- **Rev.13 (June 2013)**

.1 Origin of Change:

☑ Suggestion by an IACS Member
☑ Suggestion by GPG in response to the request of EG/SoS
☑ Suggestion by EG/GBS in response to GPG Chairman's request in 10060fIGg

.2 Main Reason for Change:

a) An inquiry from a member whether the 'Other equivalent means' referred in Para 5.3.2 of IACS UR Z10.2 include the use of Cherry Pickers for survey of other structures. (PSU 12022)
b) To introduce provision in UR Z10s that Rescue and emergency response equipment must be suitable for the configuration of the space being surveyed including the

size of the access points.(PSU 12032, GPG 12138_)

c) In order to comply with the IMO Goal Based Standard (GBS), it is required to update the Ship Construction File (SCF) throughout the ship's service life. Therefore, procedures for updating SCF have been added in UR Z10s.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) Discussion of this matter initiated by a Panel member regarding the use of Cherry Pickers in Cargo Holds with reference of IACS URZ10.2. In accordance with UI SC191 and Rec 91, the Cherry Picker is allowed up to 17m height for Cargo Hold structure (ships constructed after 2006 for Alternative means of access). As per the provisions of URZ10.2, Cherry pickers are allowed for survey of side shell frames only.

   Panel discussed and considered that Para 5.3.2 of UR Z10.2 allows the use of Cherry Pickers as 'Other equivalent means'. Accordingly, Panel agreed to clarify this matter by including text "hydraulic arm vehicles such as conventional cherry pickers" to UR Z10s and UR Z7s for a ship not subjected to the above 17m restriction.

b) GPG Chairman requested to consider the suggestion of EG/SoS to clarify the wording in UR Z 10.1 – 10.5 to make it compliance with draft PR37 submitted by EG/SoS.

   The Survey Panel discussed this matter and introduced a new (sub-)section 5.5 "Rescue and emergency response equipment" in line with the suggestion of EG/SOS.

c) At the time of reviewing the revised UR Z23 which is followed only for new construction, PT/GBS proposed that URZ10s should have provisions for updating Ship Construction File (SCF) since it would be maintained throughout the ship's service life.

   Survey Panel at its 17th meeting discussed the proposals of PT/GBS for the revision of UR Z10s in order to comply the IMO GBS requirements for existing vessels. Panel agreed to add new text in URZ10.5 for updating and monitoring the SCF.

.5 Other Resolutions Changes

a) The identical amendment affects UR Z7, UR Z7.1, UR Z10.1, UR Z10.2, UR Z10.3, and UR Z 10.4.
b) The identical amendment affects UR Z10.1, UR Z10.2, UR Z10.3 and UR Z 10.4
c) The identical amendment affects UR Z10.2 and UR Z10.4.

.6 Dates:

Panel Approval: 7 March 2013 during Survey Panel Meeting
GPG Approval: 5 June 2013 (Ref: 9640_IGn & 10060fIGn)

- ## Rev.12 (May 2012)

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reason for Change:

Based upon queries by both owners and surveyors, clarification was required for the SSH No. 2 requirements in Table I.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Completed through correspondence.

.5 Other Resolutions Changes

None

.6 Dates:

Original Proposal: 21 October 2011 2010 Made by Survey Panel
Panel Approval: March 2012
GPG Approval: 12 May 2012 (Ref: 12067_IGb)

- ## Rev.11 (July 2011)

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reason for Change:

Following external audit a member was advised that a small temporary doubler on a cross-deck strip of a bulk carrier should have been promptly and thoroughly repaired at the time of survey. The member carried out an investigation and found that the actions of the surveyor were fully justifiable, the temporary repair and short term Condition of Class imposed were an appropriate method of dealing with such a situation. The member advised that the current requirements for 'Prompt and Thorough Repair' stipulated under the UR 7 and UR 10 series do not give any leeway for carrying out temporary repairs (and imposing a Recommendation/Condition of Class in accordance PR 35) where the damage in question is isolated and localised, and in which the ship's structural integrity is not impaired.

The Survey Panel discussed the matter and agreed that under carefully defined circumstances a temporary repair and short term Recommendation/Condition of Class would be an appropriate course of action.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

The matter was discussed by correspondence within the Survey Panel and at the Autumn 2010 Panel Meeting. Following discussion at which the possibility of a Unified Interpretation being raised was considered, it was eventually decided to make direct amendment to the relevant Unified Requirements.

The wording of the new paragraph to be inserted as Para 1.3.3 in all relevant Unified Requirements was extensively discussed prior to agreement.

The proposal was unanimously agreed by Survey Panel Members.

.5 Other Resolutions Changes

The identical amendment affects UR Z7, UR Z7.1, UR Z7.2, UR Z10.1, UR Z10.2, UR Z10.3, UR Z10.4 and UR Z 10.5.

.6 Dates:

Original Proposal: *September 2010 Made by a Member*
Panel Approval: *March 2011*
GPG Approval: *27 July 2011 (Ref: 11118_IGb)*

- **Rev.10 (Mar 2011)**

.1 Origin for Change:

☑ Suggestion by IACS member

.2 Main Reason for Change:

1) Inconsistency of the definition of transverse section of the ship given in URZ7 and URZ10s.

2) Update of references in the Executive Hull Summary Table VII.

3) To make the survey requirements in UR Z10.5 compatible with the new requirements contained in CSRs.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None.

.4 History of Decisions Made:

Item 1) was proposed by RS and item 2) was proposed by GL. Both amendments were agreed by the Panel.

Regarding item 3), The Survey Panel Members decided that the task would be carried out by a Project Team, rather than through correspondence within the Panel. The PT was composed by three Members from the Survey Panel and one Member, external to the Panel, who was expert both in surveys and in structural matters. Subsequently the PT requested the Small Group on Strategy & Steering Committee that the PT were enlarged with the joining of two additional Members of the Hull Panel, in order to increase the PT's expertise in the CSRs based on the fact that CSRs would be amended, even if limitedly to requirements related to surveys after construction. The Small Group on Strategy & Steering Committee fulfilled the PT request.

.5 Other Resolutions Changes

UR Z10.1, Z10.2, Z10.3 and Z10.4.

.6 Dates:

Annex 14. **TB for Rev.14 (Jan 2014)**

See separate TB document in Annex 14.

Note: There is no separate Technical Background (TB) document available for Rev.13 (June 2013), Rev.15 (Feb 2015), Rev.16 (Nov 2016), Rev.17 (Sep 2017), Rev.18 (Jan 2018), Rev.19 (May 2019) and Rev.20 (Feb 2023).

UR Z10.5 (New, November 2003, Correction Jan 2004)

Technical background

1. Objective

WP/SRC to develop a new UR for Hull Surveys of Double Side Skin Bulk Carriers

2. Points of discussion

2.1 In 1999, GPG identified a need to develop a UR (or amend Z10.2) applicable to double side skin bulk carriers.

WP/SRC was so tasked to develop a UR tailored to the structural configuration of double hull bulk carriers and other features which distinguish double hull bulk carriers from single skin bulk carriers. The UR, when developed, would be submitted to IMO for incorporation in future amendments to A.744(18).

2.2 GPG, after the first round of the draft UR in 2003, then tasked WP/SRC to further consider the definition of bulk carriers, how to treat bulk carriers with hybrid cargo hold arrangements, survey requirements for wing ballast tanks of ore carriers (WP/SRC Task 113).

2.3 Taking into account the draft definitions of bulk carrier, single side skin bulk carrier, double side skin bulk carrier as developed at IMO MSC 77 (MSC 77/WP.13/Annex 2), GPG agreed to the definition as proposed by WP/SRC (Z10.5.1.2.1). Ore carriers are included.

2.4 GPG agreed that for bulk carriers with hybrid cargo hold arrangements, Z10.2 apply to cargo holds of single side skin(Z10.5.1.1.2).

2.5 For close-up surveys of wing ballast tanks of ore carriers, Z10.1 Table 1 (for oil tankers) shall apply (Z10.5.2.3.3).

2.6 Rafting requirements in 5.5.5 -5.5.7 are aligned with other UR Z10s.

***

Correction (2212_IGi, 26 January 2004)

2.7 WP/SRC Small Group identified inconsistency between UR Z10.2 and UR Z10.5 and proposed modifications. In Z10.2, the extent of the intermediate survey of ships between 10-15 years is to be equivalent to the previous special survey. Accordingly, the 2nd column of Table IV for intermediate survey requirements also needs to be replaced by "the requirements of the previous special survey".

1) UR Z10.2(Rev.15, Dec 2003) 4.2.3 reads that *for BCs 10-15 years of age, IS shall be the same extent of the previous SS*.
2) The current version of Z10.5 for double skin bulk carriers does not have this requirement.
3) Also, the draft UR Z10.1 (definition of POOR , draft Rev.12 – 3095_IGc of 08/08/2003) contains the same requirement for IS of oil tankers 10-15 years.
4) Z10.5.2.3.3 clearly defines the extent of overall and close-up surveys at the time of Special Surveys.
5) To keep consistency between Z10.2 and Z10.5, paras 4.2.3.1-4.2.3.3 are corrected.

*****

WP/SRC Task 102
HARMONIZATION OF UR Z7s AND Z10s

Technical Background
UR Z7 (Rev. 11)
UR Z7.1 (Rev. 2)
UR Z10.1 (Rev. 12)
UR Z10.2 (Rev. 17)
UR Z10.3 (Rev. 7)
UR Z10.4 (Rev. 2)
UR Z10.5 (Rev. 1)

Contents:

1. Objective

To amend UR Z7s and Z10s in order to make the texts of the above-mentioned URs consistent eliminating all the differences both in substance and in wording (WP/SRC Task 102).

2. Background

In the process of approving UR Z10.4, GPG found it necessary to amend the other existing URs Z10.1, Z10.2, Z10.3, Z10.6 and Z7 in order to eliminate any inconsistencies existing among them.

3. Methodology of work

The WP has progressed its work through many sessions, both during the periodical meetings and dedicated meetings restricted to a Small Group of Members (BV, DNV, GL, LR, RINA) who developed the work in order to be more efficient. All the proposed amendments of the Small Group have regularly been circulated to all Members for comment and agreement.

4. Discussion

4.1 The WP/SRC has completed a comprehensive comparative review of UR Z7 and Z10s, and identified inconsistencies which existed among them. During this review, attention was given to the severity of the requirements applicable to the same spaces/structural areas on different types of ESP ships. As a result, the inconsistencies were eliminated making the URZs harmonized. However, there has been no change to the scope and extent of the survey requirements.

4.2 The starting point for each UR was the most updated version available at the time of commencement. Any revision to the URZs, which were introduced during this task, was taken into account. As for instance, the UR Z10.1 was initially amended based on Rev. 9, while the last amendments are based on Rev. 11 and the UR Z10.2 was initially amended based on Rev. 13, while the last amendments are based on Rev. 16. The proposed revisions of URs Z10.1 and Z10.4 have not been numbered, as there will be revisions to those URs before the revisions introduced by the Task 102 are adopted. In fact, GPG is currently developing a Revision 12 of Z10.1 with the view to introducing significant improvements in the survey regime for ballast tanks (including combined cargo/ballast tanks) of oil tankers and UR Z10s applicable to oil tankers will also have to be revised by incorporating the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005 (see 4.3 below).

4.3 Also, in harmonizing UR Z10.1 and Z10.2 care has been taken to align the corresponding text with that of IMO Res. A.744(18). However, it has been noted that the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005, have not been incorporated into the IACS UR Z10s applicable to oil tankers. It seems that the updating of the above-said UR Z10s will be done by the Perm Sec and reviewed by the WP/SRC Chairman and then circulated for adoption by GPG with concurrence of Council Members for uniform application from 1 January 2005. It is understood that the revisions of the UR Z10s affected by those amendments will not include the changes introduced by the Task 102, as the implementation date proposed for those changes is 1 January 2006 (see below **6. Implementation**).

4.4 In the course of the work the WP has been developing for more than two years, several additional Tasks were assigned to the WP by GPG which affected the development of Task 102. The additional tasks which have been taken into account are the following:

1) In the course of Council discussion on UR Z10.6 (General Cargo Ships), certain inconsistencies were identified between Z10.6 and other Z10s. WP was instructed to expedite Task 102 (1060gIAa, 12 June 2002);
2) WP was instructed to include “Survey Planning for Intermediate Survey” into harmonization work (2108_IAa, 12 July 2002);
3) GPG instructed WP to consider whether Z10.6 should be re-assigned as Z7.1, in connection with the harmonization work. 1060gIAb, 20 Sept 2002.

Z7.1 developed;

4) Partial outcome (Z7 and Z7.1) was submitted to GPG on 17 July 2003(1060g). Council decided that approval of Z7(Rev.10) and Z7.1(Rev.2) is postponed until the harmonization is completed (1060gICb, 6 April 2004); Council Chairman instructed WP/SRC to Members' comments on the draft revision of UR Z7 and Z7.1 (collected under s/n 1060g, 1060gNKi (30/03/2004) in particular) on 6 April 2004.

5) GPG tasked WP to include the amendments to Z10.2 / Z11 (BCs with hybrid cargo hold arrangements), deleting sheets 15 and 16 for ore carriers, into the harmonized UR Z10s (2212aIGa, 19 Jan 2004);
6) GPG tasked WP to consider whether the requirements relevant to examination of Fuel Oil Tanks in the cargo area at each Special Survey should be put into Z 10s, and internal examination of FOT at Intermediate Survey after SS 2 is needed. (1060gIAf, 30 Jan 2004);
7) GPG tasked WP to harmonize tank testing requirements in Z7s and Z10s. (3006lIAa, 5 April 2004);
8) GPG tasked WP with Task 108 - Develop uniform survey requirements for air vent pipes including the welded connection to deck. Z22 developed. GPG instructed WP to incorporate Z22 into the harmonized Z10s;
9) GPG tasked WP with Task 114 - Verification and signature of TM reports. REC 77(Rev.1) developed and approved on 29 July 2004. Council approved parallel amendments to Z7.1 and Z10s (TM Forms included) and instructed WP to incorporate these into the harmonized Z10s:
    - Recommendation No.77 was revised (Rev.1, July 2004);
    - Z7.1 para.6.3.2 and Z10s para.7.3.2 so amended.
    - "Surveyor's signature" is deleted from all TM Forms in Z10s;
    - A note is added to Annex II(Z10s) declaring that Annex II is recommendatory.

    WP/SRC's investigation into Members' practice in dealing with verification and signature of TM reports is annexed for record keeping purpose. See Annex 2.

10) GPG tasked WP to consider the BV comments on "TM may be dispensed with…." and include the findings into the harmonized Z10s (2219iIAa, 7 April 2004).

5. Agreement within the WP/SRC

All Members have unanimously agreed the attached final versions of UR's.

6. Implementation

WP/SRC is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming Council adoption in December 2004, WP/SRC would propose January 2006 as implementation date.

Annex 1: TB for UR Z10.1(Rev.12, C49 amendments, see Permsec's note 1 below)
Annex 2: WP/SRC Task 114, verification and signature of TM reports(see 9 above).
Annex 3**:** TB for revision of UR Zs concerning "anodes".

Note by the Permanent Secretariat

1. Annex 1 to this TB contains background for amendments to UR Z 10.1(Rev.12) relating to FAIR/POOR/GOOD (C49 amendments). Council at its 49th meeting (June 2004) agreed/decided that comparable changes should be added to Z10.3 and Z10.4.

2. Appendix 3 "TM sampling method" has been added to UR Z10.1 and Z10.4 to keep them consistent with IMO Res.MSC.144(77). The amendments to A.744 contained in MSC.144(77) entered into force on 1 January 2005. *(GPG s/n 4181)*

Under s/n 4072g, paragraph **2.4.6** of UR Z10.1 and **2.4.6** and of UR Z10.4 (paragraph numbering is now harmonized) were amended in order to provide a link between the main text of the UR Z10.1 and 10.4 and the new Annex III Appendix 3 containing the MSC Res.144(77).

Further, it was agreed that the requirements for evaluation of longitudinal strength of the hull girder (as written in MSC.144(77)) should not be required for Intermediate Survey unless deemed necessary by the attending Surveyor. This is covered in 4.2.3.1 and 4.2.4.1 of Z10.1 and Z10.4.

3. GPG agreed that the amended UR Zs should be implemented from 1 July 2006 altogether.

4. DNV's proposed amendments to UR Z10.1, Z10.3 and Z10.4 concerning annual survey of ballast tanks were agreed by Council (1060gICq, 27 June 2005). See Appendix 2 to Annex 1.

5. Annex 3 contains a TB for revision of UR Zs concerning "anodes".

Date: September 2004
Prepared by the WP/SRC

– – –

Annex 1 to Technical Background
UR Z 10.1 (Rev.12, C49 amendments(coating-related))

1. Objective

To introduce significant improvements in the survey regime for ballast tanks (including combined/ballast tanks) of oil tankers as matter of strategic concern and urgency to IACS, given the aging of both the single and double hull tanker fleets and the problems encountered with corrosion of ballast tanks in several shipping casualties.

2. Background

Draft amendments to UR Z10.1 were submitted to Council 47 (June 2003) and agreed in principle.

3. Discussion

There was particular concern over accelerated corrosion with age (as the thinner the material, the more rapidly the allowable diminution margin percentage disappears) especially where coatings have broken down. There is also a disincentive for any spend on maintenance of the structure of a ship within a few years of its statutory scrapping date.

Council discussion by correspondence had evolved to the position of substantive proposals – summed as follows (3095_ABa, 2 June 2003):

1. Enhance the Intermediate Survey in Z10.1, Z10.3 and 10.4 for Tankers after 2nd Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey). This corresponds to the latest revision to UR Z10.2.
2. At Annual Survey of ballast tanks with substantial corrosion, the overall survey is to be replaced by close-up survey with thickness measurements of the exposed area.
3. Proposed to task WP/SRC to re-consider the acceptance criteria for the rating FAIR further. For this, eliminate FAIR, leaving only GOOD and POOR redefined as appropriate.
4. Proposed to task WP/SRC to explicitly require close-up survey of Suspect Areas identified at the previous Special Survey.

Council 47 discussed the proposals(June 2003) as follows:

1. Definition of FAIR
   Council 47 agreed that "FAIR" would be retained as a rating and that GPG should instruct WP/SRC to redefine FAIR, so that there would be a clear differences between FAIR, POOR and GOOD. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have the same scope as Special Survey No.2(Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

   Based on the strong majority, Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

   > *DNV and NK stated that they could not accept a requirement for annual surveys of ballast tanks when the coating condition is less*

than GOOD and proposed that GOOD be changed to FAIR (3095_IGc, 30 June 2003)

2. ABS' proposed amendments to Z10.1(annual examination of BWTs in certain conditions) were approved.
3. C 47 agreed that the BWT coating requirements (Z10.1.2.2.3) for intermediate Survey after SS 2 should be the same extent to the previous SS.
4. Given the substance of the changes, the revised Z10.1 should be shown to Industry before adoption.
5. A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.

Following Council 47, the draft text of Z10.1(Rev.12) was distributed to Industry and discussed at the IACS/Industry meeting on 29 August 2003. Industry indicated that UR Z10.1(Rev.12) is acceptable, provided that appropriate IACS guidelines on coating repairs are developed.

The Small Group on Coating (SG/Coating) under WP/SRC prepared draft guidelines on coating repairs and considered the definitions of GOOD / FAIR / POOR. The SG/Coating did not change the definitions and found that the Guidelines provide useful clarifications on the definitions and criteria in achieving an industry wide uniform judgement of coating conditions as well as what is needed to restore GOOD conditions.
Further, an IACS/Industry JWG/Corrosion was established and met in February 2004. The outcome is (3095_IGh, 4 June 2004):

- Draft Guidelines on Coating Repair (IACS REC 87)
- Draft UR Zxx (mandatory coating of cargo tanks on oil tankers)
- Draft UI SC 122 (Rev.2) – mandatory coating of ballast tanks

4. Others

1. Z10.11.2.2bis - Definition of "Combined Cargo/Ballast Tank. …as a routine part of the vessel's operation and will be treated as a Ballast Tank. ...". By so amending, Z10s do not need to repeat "Ballast Tanks *and Combined cargo/salt water Ballast Tanks*" in addressing the ballast tanks. Hence, all the references to "*and Combined cargo/salt water Ballast Tanks"* were deleted.
2. Z10.1.2.2.1.2: The aim of the examination is ~~to be sufficient~~ to discover substantial corrosion…
   Comparable changes are to be added to other UR Zs wherever the same sentence occurs.
3. "IACS Guidelines for Coating Maintenance & Repairs for Ballast Tanks and Combined/Ballast tanks on Oil Tankers" are referenced where relevant.
4. Comparable changes are to be added to UR Z10.3 and Z10.4, after adoption of Z10.1(Rev.12).

Attached: Memo on Coating Matters (GPG Chairman)

9 June 2004
Prepared by the Permsec

Appendix 1 to Annex 1: MEMO on Coating matters

1. Background and discussion within IACS on UR Z10.1 (draft Rev.12) between 29/01/03 and 14/08/03

In view of the survey experience with oil tankers, it was proposed that all ballast tanks should be examined, routinely and uniformly, at annual surveys on ESP tankers exceeding 15 years of age. IACS should amend UR Z10.1 to require the examination of ballast tanks on such ships at each annual survey. This is simple, clear and thorough and not subject to interpretation. (2242_ABq dated 29/1/03)

Then, ABS modified the proposal asking, for tankers subject to URs Z10.1, Z10.3 and Z10.4, exceeding 15 years of age, that the current requirement - pertaining to annual examination of Ballast Tanks adjacent to cargo tanks with any means of heating - be deleted and replaced by a simpler and more stringent requirement that all Ballast Tanks be subject to survey at each subsequent annual survey where either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and the protective coating is not renewed at special survey or intermediate survey. This will ensure that all Ballast Tanks with substantial corrosion or protective coating which is not in GOOD condition at the time of special survey or intermediate survey will be examined at each subsequent annual survey on tankers exceeding 15 years of age. (2242_ABzb dated 14/3/03)
This was later expanded to include all tanks used routinely for ballast water, both ballast-only and cargo/ballast tanks (2242_ABzc dated 14/3/03).

ABS further reviewed the issue of the survey of salt water ballast spaces and combined cargo/salt water ballast spaces with ABS' governing bodies in light of recent casualties and survey findings on other tankers. Their review found an increasing amount of coating breakdown/failure and subsequent rapid wastage in key structures after Special Survey No. 2, i.e. after 10 years of age. These conditions are most prevalent in the under deck structure and the side shell structure in way of the deep loadline. In a number of cases the serious wastage has caused fracturing of the under deck longitudinals and in some cases fracturing has extended to the main deck structure. This led ABS to refine proposed amendments to URs Z10.1, Z10.3 and Z10.4 to require (2242_ABzf dated 9/5/03):

a. For Tankers exceeding 10 years of age

> Salt Water Ballast Spaces and Combined Cargo/Salt Water Ballast Spaces. For tankers exceeding 10 years of age, salt water ballast spaces and combined cargo/salt water ballast spaces are to be internally examined at each subsequent Annual Survey where substantial corrosion is found within the tank or where the protective coating is found to be less than GOOD condition and protective coating is not repaired. Internal examination to be an Overall Survey.

b. For Tankers exceeding 15 years of age:

Salt Water Ballast Spaces and Combined Cargo/Ballast Spaces. For tankers exceeding 15 years of age, salt water ballast spaces and combined cargo/ballast spaces are to be examined internally at each subsequent Annual Survey. Where substantial corrosion is found within the tank, or where the protective coating is found to be in less than GOOD condition and the protective coating is not repaired then in addition to an Overall Survey, under deck structure and the side shell structure in way of the deep loadline is to be subject to Close-up Survey.

NK and BV replied that the proposed amendments made by ABS need to be substantiated in a transparent manner with technical data that ABS may possess and put forward for further assessment and discussion. (2242_NKn dated 14/5/03 and 2242_BVz dated 16/5/03)

DNV (2242_NVn dated 2/6/03), having carefully considered the practical consequences of taking the ship off-hire for gas freeing etc. and being concerned about the difficulties to have these surveys executed in a safe manner and whether the intended safety benefits in implementing the proposed extended scope of the annual survey of Ballast tanks will be met, **proposed the following alternative measures** which would be as effective and may not have such delaying effects to the ship:

1) Enhance the Intermediate Survey in UR Z10.1, 10.3, and 10.4 for Tankers after the 2 Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey. (This will correspond to the latest revised requirements of UR Z10.2 for Bulk Carriers.)
2) At Annual Survey of ballast tanks with substantial corrosion the overall survey should be replaced by close up survey with thickness measurements of the exposed area. (An overall survey of these tanks does not give sufficient information of the development of the areas with substantial corrosion.)
3) Further we will not fail to mention that the WP/SRC has proposed to extend the close up survey in cargo and combination tanks to 30% from the 3 Special / Renewal Surveys.
4) **Experience has shown that the coating condition rating category FAIR has a tendency to be stretched too far into the POOR condition. We will therefore propose that we task the WP/SRC to reconsider the acceptance criteria for the rating FAIR further.**
5) We do also question the need for redefining the definition of combination tanks, particularly since the category I tankers which are the ships that normally are fitted with these type of tanks are to be phased out 2 to 4 years from now. However DNV will not oppose to such a redefinition.

DNV requested Members to consider the above as an alternative to the ABS proposal, bearing in mind that we ought to present this to the industry prior to deciding.

ABS (3095_Aba dated 2/6/03), having further considered its earlier proposals in light of NVn, submitted a revised proposal for consideration by Council at C47 and replied to the above 5 DNV proposals as follows:

1) ABS fully supports this proposal.
2) While ABS agrees with this proposal, it is in fact already provided for in Z7 (3.2.3) and Z10.1 (3.2.5.1)--which require that "Suspect areas (which include any area where substantial corrosion is found) identified at previous Special Survey are to be examined. Areas of substantial corrosion identified at previous special or intermediate survey are to have thickness measurements taken." To us, this implies that close-up survey of these areas is to be done at annual survey in conjunction with the thickness measurements. However, we can

agree to tasking WP/SRC to explicitly require "close-up" survey in this connection and to amend Z7, and all the Z10's, appropriately to make this explicit, if there is majority support for this.

3) We agree that this has been put forward to GPG by WP/SRC via 0237hNVb, 27 May. However, these additional CAS close-up survey requirements do not apply to salt water ballast tanks; only to cargo oil tanks and combined cargo/ballast tanks.
4) **We agree with this assessment and we propose that the only way to eliminate the subjectivity and raise the standard is to eliminate the category "FAIR" completely; leaving only "GOOD" and "POOR" redefined as follows:**
   "GOOD -- condition with no breakdown or rusting or only minor spot rusting.
   POOR -- any condition which is not GOOD condition."
5) ABS does not agree with this proposal. We are particularly concerned that we need a very thorough and robust survey regime for these tankers precisely because they are subject to mandatory phase out over the next several years. We are very concerned that without additional IACS requirements, these tanks will receive little or no inspection and maintenance by owners or others after their last special or intermediate survey, if no substantial corrosion is found at that time. Rapid, localized wastage in way of deteriorating coatings may pose significant hazard if the survey regime is not further tightened as we are proposing.

In conjunction with the above comments on DNV proposals, ABS further considered their previous proposal in ABzf and modified it as follows:

- **ABS simplified the proposal to require annual examination of all salt water Ballast Tanks and combined Cargo/salt water Ballast Tanks irrespective of age, when either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and is not repaired.**
- the requirement for annual (close-up) examination of salt water ballast tanks and combined tanks is already required in Z10.1 (3.2.5.1). ABS proposed adding it to 2.2.3 for clarity and emphasis so that all the conditions which may lead to annual examination of such tanks are listed together in one place.
- Since the principal problem that we are trying to address is rapid, localized corrosion in way of breakdown or deterioration of the protective coating, we are proposing that the coating condition should be found and kept in "GOOD" condition to obviate the need for annual examination. **The attached proposal is made together with the proposals in items 3.1 (intermediate following Special survey 2 to have same scope as prior Special survey) and 3.4 (eliminating "FAIR" and redefining "POOR" as any condition other than "GOOD" condition.**

ABS requested to decide on a course of action at C47 for tightening the survey regime for tankers. They agreed that industry be informed of Council's decisions in this regard prior to IACS making the decision public, but IACS should maintain its independence and take decisive action in this matter. Debate with industry can only lead to delay and to a watering down and compromising of these important requirements.

NK agreed to task WP/SRC to reconsider the acceptance criteria of "FAIR" for clearly define the border between "FAIR" and "POOR" condition. However, **NK strongly opposed the elimination of "FAIR" coating condition from UR Zs** because this can not resolve to remove subjectivity of coating assessment. The three-categorization system of coating condition should be retained. (3095_NKa dated 5/5/03)

<u>Outcome of C47</u>

At **C47**, it was agreed that "Fair" would be retained as a rating and that GPG should instruct WP/SRC to redefine "Fair", so that there would be a clear differentiation between "Fair", "Poor" and "Good". It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have same scope as Special Survey No.2 (Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

Based on strong majority support Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

This matter should be discussed with Industry prior to adoption of any UR by Council.

In a final summary, the Chairman proposed that a constructive dialogue with Industry should take place on the IACS proposal as set out in WP1 plus maintaining 3.2.5.2 modified to say that ballast/combined ballast/cargo tanks will be subject to annual survey when considered necessary by surveyors.

After discussion in the JWG (Industry/IACS), GPG should propose final rules for this matter to Council, including acceptable repair definition.
F**UA 17:** *To instruct WP/SRC to develop guidance on coating repairs and more precise definition of "Fair" coating condition.*
Once approved, these requirements should be incorporated into Z10.3 and Z10.4.
FUA 15

1) *To prepare a draft revision to UR Z10.1 incorporating C 47 decisions:*
   - *The definition of "FAIR" remains as it is;*
   - *ABS proposed amendments to Z10.1 (annual examination of BWTs in certain conditions) were approved;*
   - *C47 agreed that the BWT coating requirements (Z10.1.2.2.3) for Intermediate Survey after Special Survey No.2 should be the same extent to the previous Special Survey.*
   - *Given the substance of the changes, the revised UR Z10.1 should be shown to Industry (OCIMG/Intertanko first among others) before adoption for their review and comments.*
   - *A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.*

2) *GPG Members are to confirm the draft revision to Z10.1 in consultation with their WP/SRC members by correspondence. See 3095_IGa of 13/06/03.*

According to C47 FUA 15, GPG Chairman circulated (3095_IGa dated 13/6/03) draft amendments to UR Z10.1 as agreed in principle at C47.

Having received a number on comments, GPG Chairman (3095_IGb dated 27/6/03) informed that the Council Chairman confirmed that GPG is not to amend the principles agreed at C47, i.e. we are not empowered to change "GOOD" to "FAIR" as proposed by DNV and NK, nor to amend the definitions of "FAIR" and "POOR" as proposed by DNV.

DNV's intention to possibly lodge a reservation was noted, however the matter should be raised at Council and not be dealt with by GPG. An amended draft text incorporating the non-substantive changes proposed by Members was circulated.

DNV said that its understanding was that the draft should be circulated to the Industry (ICS, INTERTANKO, and BIMCO) prior to adoption by Council. (3095_NVc dated 30/6/03)

GPG Chairman (3095_IGc dated 30/6/03) circulated a draft amendment of UR Z10.1 for Council's agreement and use in discussions with the industry associations.
The draft was generally agreed by GPG but individual Members have requested that the following matters (which were deemed to be outside the remit of GPG in this task) be brought to Council's attention for further consideration:

1. DNV and NK stated that they can not accept a requirement for annual surveys of ballast tanks when the coating condition is less than GOOD and propose that GOOD be changed to FAIR.
2. In connection with item 1 above, DNV also propose to amend the definitions of FAIR and POOR in order to raise the standard of FAIR.

Council Chairman (3095_ICb dated 14/8/03) concluded that Council has agreed that the draft amendments to UR Z10.1 attached to IGc reflect Councils' decision taken at C47 and that they be circulated to industry associations.
Perm Sec was therefore invited to submit the draft to OCIMF and INTERTANKO in view of discussion at the IACS/ industry meeting on 29 August.

2. Discussion with Industry (29/08/2003 – 11/10/2003)

As requested by Council, the whole matter was presented to Industry during the "general matters" meeting with IACS held on 29 August 2003; comments from Industry were requested. In the following an extract from the minutes of the meeting (see message 3100aIAb dated 5 September 2003):

__________________________ from Meeting minutes ________________________________

4. & 5. Annual surveys of ballast tanks and IACS guidelines on coating repairs

M. Dogliani introduced the matter (see Items 4&5 in Appendix).

A. LinoCosta gave a presentation to show where concerns and decisions stand: too many cases when coating was considered fair at SS but problems occurred just after one/two years.

N. Mikelis commented on draft amendments to Z10.1 (Rev.11) stating that the extent of annual survey is not clear; it should be limited to the affected zones, e.g. coating breakdowns, only.
M. Guyader clarified that, in this draft amendments, it is expected an overall survey of the whole tank and a close up survey of the affected zones.
N. Mikelis noted that, in the draft amendments to Z10.1 (Rev.11), the intermediate survey at 12.5 years would have the same scope as the previous special survey and that needed a justification. See 7 a).
M. Dogliani said that Z10.1 (Rev.11) was adopted in August 2003 and will be introduced into IACS Societies' Rules over the next year.

Conclusions:
4.1 Industry shared IACS concerns on coatings and, in general, agreed with the draft amendments to Z10.1 (Rev.11) suggesting also extending them to Z10.2 on bulk carriers

4.2 Industry agreed that a guideline for surveyor on coating would greatly improve uniform application of so-amended Z10.1 including issues such as how to consider load bearing elements when judging GOOD/FAIR/POOR status and how to consider bottom pitting in connection with GOOD conditions
4.3 Industry will more precisely comment, by the end of September, the draft Z10.1 so as for IACS to finalise the matter, as planned, for the Council's December meeting.

Item	Title	Industry recommandation	IACS/ M. Dogliani Introduction
4 & 5	Annual survey of ballast tanks IACS guidelines on coating repairs	NN	**1. IACS is considering the following:** - **amend UR Z10.1 (draft circulated to Industry) to the effect that in case at Special Survey or Intermediate Survey the coating in a ballast tank is found less than GOOD, either GOOD conditions are restored or the tank's coating is inspected at each annual survey;** - **develop IACS guideline to assist an uniform application of the so modified (if adopted) UR Z10.1; the guideline should address which repairs are necessary to restore GOOD conditions from FAIR and POOR respectively and which are the criteria for the restored (after repair) situation to be rated as GOOD.**

______________________________ End of extract from minutes ____________________________

INTERTANKO commented (see R. Leslie email to GPG dated 25 September 2003):

- expressing their concern for the draft Z10.1 and underlining

a) targeting: concerns that, if not properly dealt with, Z10.1 would target all ships and not just those which need intervention; the view was expressed that guidelines would probably solve the matter;

b) definition: indicating that the current definitions of GOOD, FAIR and POOR is not clear enough and that the matter would be even worst with GOOD and NON GOOD; again it was indicated that guidelines could solve the matter;

c) expertise: expressing doubts on IACS' surveyors expertise and ability to judge coating conditions; in this respect they (hiddenly) suggest that IACS position is unclear when we say that we are not competent to judge the coating during construction but then we are competent to judge coating during operational life. Even if not explicitly stated, the impression is that also in this case guidelines would help.

Additionaly, INTERTANKO suggested a (quite detailed) set of assessment criteria.

The matter was then finally addressed at the TRIPARTITE Meeting (held in Soul on 29/30 September 2003). There Industry agreed that the way forward was the (joint) development of IACS guidelines (see minutes attached to message 3100_RIe dated 11 October 2003, an extract of which is reproduced below).

______________________________ Extract from the TRIPARTITE minutes ________________

Industry is concerned by the definition of GOOD/NOT GOOD in relation to coating repairs and acceptance criteria. Industry agreed that new guideline on this, which IACS is already producing, was the way forward.

______________________________ End of the extract from the minutes __________________

3. Further developments

a) from the above, it was concluded that, provided the guidelines are sound, Industry would accept the concept of Z10.1 (draft) Rev. 12, therefore an IACS team and a JWG were established in order to progress the matter of the guidelines (among other related matters).

b) the team of IACS experts on coating developed draft guidelines and provided recommendations to GPG on the way forward (attached to message 3095bNVc dated 20 November 2003).

c) the guidelines were discussed within the JWG with Industry (see draft minutes circulated within GPG with messages 3095cIGd and 3095cIGe both dated 13 March 2004)

d) further suggestions and comments (as requested at the meeting) were provided by Industry (not circulated to GPG)

e) Bulk Carrier Industry is recommending that similar guidelines are developed in due time also for bulk carriers

f) at DE47 and MSC78, IMO is asking Industry and IACS to develop (compulsory) performance standards for coating of newbuilding (double hull spaces of DSS Bulk Carriers), a matter which is, indirectly related to the above one.

1 June 2004
M. Dogliani
IACS GPG Chairman
IACS JWG/COR Chairman

Subject: FW: 1060gNVs; WP/SRC - Task 102 - Harmonization of UR Z 7 and Z 7.1

25 May 2005

To: Mr. B. Anne, Chairman of IACS Council,
cc: Council Members, IACS Perm. Sec.

Ref.: My mail NVr dated 20 May 2005

DNV have further studied the amendments to UR Z10.1, Z10.3, and Z10.4, and as a result are presenting the following as a compromise solution:

General comment:
From the comments by other Members it is obvious that there is reluctance to accept annual surveys of ballast tanks with a common plane boundary to heated cargo tanks in the case where the coating is in good condition. This is particularly unreasonable as at the same time we enhance the Intermediate survey of Tankers between 10 and 15 years to also include examination of all ballast tanks, meaning that all ballast tanks will be close up surveyed with 2-3 years intervals from the ship is 10 years old, with the possibility for the surveyor to require thickness measurements and testing of the tanks to ensure the structural integrity of the tanks if necessary.
It is also proposed for the Intermediate survey between 5 and 10 years, to increas the scope from representative to all ballast tanks, a requirement DNV find to strict, and require that we here keep the original text.
If a ballast tank is found to have coating in GOOD condition at the renewal or intermediate survey, a deterioration of the tank beyond structural reliability is very unlikely even if the tank has a common plane boundary to a heated cargo tank.

DNV finds it particularly unreasonable to have this requirement to apply to double hull tankers for the following reasons:
- these ships have double hull and the risk of pollution is here much reduced,
- the double hull is constructed with small spaces giving improved structural reliability,
- almost all double hull tankers below VLLC have heated cargo tanks, and all ballast tanks have common plane boundaries to these tanks, meaning that this requirement will apply to a major part of the tanker fleet in the future,
- the ballast tanks of double hull tankers are so designed that a general examination of these tanks will be identical to a close up survey,
- survey of ballast tanks of double hull tankers will mean either gas freeing of all cargo tanks or at least dropping the inert gas pressure of all cargo tanks in addition to proper airing of all ballast tanks.

Since the single hull tankers will be faced out in the near future, and for clear political reasons, DNV will as a compromise proposal to keep paragraph 2.2.3.1 and 4.2.2.2 in Z 10.1 as amended by Council (ref. IAo) but amend it to not include 2.2.3.1.e, 4.2.2.2.e and last paragraph of 3.2.5.1 in Z10.3 and Z10.4. In addition we request that the original text of 4.2.2.1 is kept.
If BV, ABS and other Members can accept this DNV is willing to drop our reservation presented at C49.
DNV's proposal will then be as follows:

Z10.1:

2.2.3.1: This paragraph can be accepted as is for the reasons stated above.
3.2.5.1: This paragraph is accepted as amended.
4.2.2.2: This paragraph can be accepted as is for reasons stated above.

For other comments to Z10.1 see NVo and NVp.

Z10.3:

2.2.3.1.e to be deleted.
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept."For tanks used for water ballast ---"
4.2.2.2.e to be deleted

Z10.4

2.2.3.1e to be deleted
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept, "For tanks used for water ballast --"
4.2.2.2.e to be deleted.

For details see attached document where the text for the requirements in Z10.3 and Z10.4 that DNV will accept is stated.

Best Regards

Arve Myklebust
on behalf of
Terje Staalstrom
DNV IACS Council Member
<<Doc1.doc>>

Annex 2 to TB (Harmonization Z10s)

WP/SRC Task 114 "Clarify the procedure of verification and signature of the thickness measurement report"

Item No.	**Item**	**ABS**	**BV[1)]**	**CCS**	**CRS**	**DNV**	**GL**	**IRS**	**KR**	**LR**	**NK**	**RINA**	**RS**
1	**Verification onboard**	.											
1.1	Minimum extent of measuring points for direct verification by attending surveyor specified	No	No	No	No	No	No	No	Yes	No	No	Yes	No
1.2	Preliminary TM record to be signed upon completion of the measurements onboard	Yes	Yes [7)]	Yes	No (copy taken)	No[3)]	No[6)]	Yes	Yes	Yes	Yes	No[8)]	No
2	**Final TM report**												
2.1	Signature of all pages in TM record required	No	No	No	Yes	No	Yes	Yes	No	No	No[5)]	Yes	Yes
2.2	Signature of 'cover' ('general particulars') page only	Yes	Yes	Yes	No	Yes	No	No	No[4)]	Yes	Yes	Yes	No
2.3	Measuring points verified by attending surveyor required identified in TM record and signature of the corresponding pages required	No	No	Yes Without signature	Yes	No	No	No	Yes	No	No	No	No

2004-04-20

[1)] Instructions not clear regarding signature of the thickness measurement record

[2)] Signature on front and last page, stamp on all other pages, or signature on each page (IACS TM forms)

[3)] Upon completion of measurements onboard a draft report in electronic format (DNV TM template, including operator's notes as relevant) to be given to attending surveyor

[4)] Signature of cover page, pages of meeting record and pages of attended measuring points

[5)] Each page to be signed in case of 'loose-leaf' type record

[6)] Preliminary TM record has to be passed to the Surveyor, signed by the Operator

[7)] The only measures which the Surveyors can certify exact are those for which that they have seen the results on the screen of the apparatus. That means in fact few points in comparison with the numbers of recorded measures.

8) The Surveyor reviews the TM record for completeness and assessment of TM readings, but no signature required.

Annex 3: **Technical Background**
(May 2005)

UR Z7s and Z10s (Corrosion Prevention System)

1. Objective:

To clarify whether the survey of anodes is a class matter, and if so, whether acceptance criteria for anode should be developed.

2. Method: GPG by correspondence (5037_)

3. Discussion

3.1 BV initiated GPG discussion as follows:

Paris La Défense, 8 Mars 05

1 - We have noticed that, in the draft UR Z's (7.1, 10.1 to 10.5) issued further to the WP/SRC Task 102, the original sentence "......the examination may be limited to a verification that the hard protective coating remains efficient......" has been replaced by ....that the corrosion prevention system remains efficient....". in a number of paragraphs (such as , for instance, Z 7.1, 4.2.3.1 a) ; Z 10.2 4.2.3.3 ;), in line with IMO Res.A744(18).

2 - However, a corrosion prevention system is defined, in the same UR Z's and in IMO Res.A744(18) , as being either a full hard protective coating or a full hard protective coating supplemented by anodes.

3 - The above would mean that the survey of the anodes is a classification matter.

4 - However, whereas coating conditions are defined as good or fair or poor, there are no criteria in the IACS URs and IMO Res. A744(18) for the anodes condition.

5 - Assessing the anodes condition to confirm that they "remain efficient" looks to BV to be a quite difficult task for the ships in service Surveyor.

6 - Member's view and interpretations on the following would consequently be appreciated:

- do Members consider that the above requirements in IACS URs imply that survey of anodes is part of the classification ?
- do Members consider that the above requirements in IMO Res. A 744 (18) imply that survey of anodes is mandatory?
- if yes, what is the acceptance criteria to conclude that the anodes" remain efficient" ?

3.2 The majority of GPG Members replied that they did not include requirements for anodes in their class rules.

LR / ABS / DNV / KR / NK / RINA / RS were of the view that the condition of any anodes fitted should be recorded for information purposes as the survey of anodes is neither a classification matter nor a mandatory requirement in IMO A.744(18) and has no impact on future surveys (5037_LRa**). [**Note; LR further clarified that “Whilst I agree that the performance of anodes is not normally a class matter LR does require that as part of Special Survey on oil tankers : "The attachment to the structure and condition of anodes in tanks are to be examined ." Therefore we cannot say that 'the survey of anodes is not a classification matter'**. 5037_LRb]**

However, GL said that "for GL, anodes are a matter of class and as such are subject to plan approval as well as surveys. In case of missing or worn-out anodes we issue a condition of class"(5037_GLa&b).

CCS advised that its rules have a general requirement relating to anode survey, which is only conducted, through sampling, during construction, docking survey or where there is a definite requirement for the survey of ballast tanks.

NK proposed that the following footnote be added to Z7s and Z10s:
"The survey of anodes is not a classification matter." No majority support was achieved.

4. Conclusion

RINA suggested to simply amend the definition of "Corrosion Prevention System" in paragraph 1.2.9 of UR Z7 (and, of course, the paragraphs in all the other UR Zs containing the definition of "Corrosion Prevention System") in order to eliminate any reference to anodes. This proposal would leave room for Societies willing to include additional class requirements for anodes to do so in their Rules.

GPG agreed.

RINA proposed amendments to paragraph 1.2.9 of UR Z7
and corresponding paragraphs in all other UR Zs
(5037_RIb, 6 April 2005)

1.2.9 Corrosion Prevention System

A corrosion prevention system is normally considered ~~either:~~ a full hard protective coating.
~~.1 a full hard protective coating, or~~
~~.2 a full hard protective coating supplemented by anodes.~~
Hard protective coating is usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specifications.
Where soft coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

Annex: Council Chair's conclusive message.

6 May 2005
Permsec

Annex. (5037_ICb, 15 May 2005)

To : All IACS Council Members
c.c : Mr. R. Leslie, IACS Permanent Secretariat

Ref. Mr G-Y. Han's message IAa dated 6 May 05
Message ICa dated 6 May 05
Admiral R.E. Kramek's message ABb dated 13 May 05

Paris La Défense, 15 May 05

1 - All Members have agreed with the texts attached to Mr Han's message.

2 - Further to ABS comments the reference to anodes is to be deleted in Annex I and in tables IX (IV) and IX(II).

3 - further to ABS questions regarding what IACS plan to do regarding IMO and A.744(18) further to IACS deletion of reference to anodes from the UR Z7's and UR Z10's it is to noted that:

The Item 1.2.9 in UR Z1O.1 and relative items in these URs states
1.2.9 10 Corrosion Prevention System: A corrosion prevention system is normally considered either:
.1 a full hard protective coating, or
.2 a full hard protective coating supplemented by anodes.
Hard Pprotective Ccoating is to usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specification.
Where Soft Coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

- therefore the anodes are not considered as the main means of protection against the corrosion It is only a supplement;

- there is no provision in UR Z7's and Z10's to evaluate the level efficiency of the anodes;

- there is no specific requirements in case of lack of efficiency of the anodes.

The experience has shown that ballast tanks only protected by anodes are subject to corrosion when the anodes are becoming less efficient.

The anodes are active only when immersed by sea water. Therefore the upper part of the ballast tanks are not protected when the ballast is full of water and the ballast is not protected when it is empty..

The ships operators are reluctant to replace the anodes especially in upper part which request fitting of scaffolding fo welding the anode supports to the structure.

The above arguments justify the reasons why IACS consider that the anodes are not class item.

4 - These arguments can be used by IACS Members attending the WG bulk carriers at MSC 80 to try to obtain deletion of the reference to anodes in A. 744(18).

Best regards,

Bernard Anne
IACS Council Chairman.

Technical Background

UR Z10.1(Rev.13, Jan 2006)
UR Z10.2(Rev.18, Jan 2006)-separate TB
UR Z10.3(Rev.8, Jan 2006)
UR Z10.4(Rev.3, Jan 2006)
UR Z10.5(Rev.2, Jan 2006)

Part 1. Z10s – para. 1.4 and 7.1.3

Part 2. Z10s – para. 5.5.4 and 5.5.6

Survey Panel Task 22 – Amend applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

Technical Background

Z7(Rev.12)
Z7.1(Rev.3)
Z10.1(Rev.13, para.1.4 & 7.1.3)
Z10.2(Rev.18, para. 1.4 & 7.1.3)
Z10.3(Rev.8, para. 1.4 & 7.1.3)
Z10.4(Rev.3, para. 1.4 & 7.1.3)
Z10.5(Rev.2, para. 1.4 & 7.1.3)

1. **Objective**

To amend the applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

2. **Background**

IACS QC findings, through audits of numerous Societies, which indicated concerns over Surveyor attendance and control of thickness measurement processes.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

To align Close-up survey requirements and thickness measurements in the applicable URZ7s and URZ10s, in accordance with PR19, all Panel members agreed through correspondence and a final vote at the fall Survey Panel meeting, that URZ7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 should include in the applicable sections of the noted URs as proposed by the Survey Panel the wording " In any kind of survey, i.e. special, intermediate, annual, or other surveys having the scope of the foregoing ones, thickness measurements of structures in areas where close-up surveys are required, shall be carried out simultaneously with close-ups surveys."

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Technical Background

UI SC 191 (Rev.2, Oct 2005)

&

UR Z10.1 (Rev.13, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.2 (Rev.18, para. 5.5.4 and 5.5.6, Jan 2006)
UR Z10.3 (Rev.8, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.4 (Rev.3, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.5 (Rev.2, para.5.5.4 and 5.5.6, Jan 2006)

1. Objective

- to confirm whether the guidelines for approval/acceptance of alternative means of access (now REC91, ex Annex to UI SC191) is mandatory or non-mandatory.
- to consider other safety related proposals.

2. Background

The DNV proposal to submit the UI SC191(Rev.1, May 2005, Annex 1) to IMO DE49 triggered a number of discussion points that led to amendments to the following resolutions:

UI SC191(Rev.2)
New REC 91
REC 39(Rev.2)
UR Z10s

Points of Discussion

3. Is the Annex to UI SC191(Rev.1, May '05, guidelines for approval / acceptance of alternative means of access) mandatory or non-mandatory ?

   Answer: Non-mandatory. Hence, re-categorized as new REC 91.

4. Limitation of use of rafts in bulk carrier holds

   DNV proposed that conditions for rafting should be limited to areas, such as anchorage or harbour, where swell conditions are limited to 0.5m. After discussion, GPG approved the ABS' alternative proposal to use the swell condition as a basis to determine the appropriateness of rafting, instead of geographic areas(harbours or anchorage). 5.5.4 of Z10.2 refers.

RINa proposed that para 5.5.4 should be included in all the Z10s. NK's objection is recorded as follows (3037hNKq, 29/08/2005):

> 1. With regard to RIm of 26 August 2005, NK considers that the proposed amendment to 5.5.4 should be limited to UR Z10.2.
>
> 2. Rafting survey for tankers are actually carried out on the open sea from a discharge port to a loading port and in such situation the rise of water within the tanks would always exceed 0.25m. It is different situation from rafting survey for hold frames of bulk carriers normally conducted in a harbour or at an anchorage.
>
> 3. If the same requirement applies to tankers, any rafting survey for cargo oil tanks and ballast tanks of tankers would be prohibited. This is not practicable under present survey procedure for tankers.
>
> 4. Therefore, NK can not support Laura's proposal that the proposed amendment to 5.5.4 of UR Z10.2 is introduced into the other URs and new Recommendation.

For compatibility with the IMO's mandatory requirements*, GPG decided to add the same amendment to all the UR Z10s.

*

- Appendix 4 to MEPC.99(48) ' Mandatory requirements for the Safe Conduct of CAS Surveys'
- MSC.197(80) – amendments to A.744918), Annex A for DSS and SSS bulk carriers and Annex B for single and double hull oil tankers.

As a consequence, 5.5.1 of REC 91(ex Annex to UI SC191) was also amended:

-to remove the reference to dynamic /sloshing (as the 0.25m rise was considered negligible);
-to refer to the rafting conditions contained for cargo holds in Z10.2 and Z10.5 and for oil cargo tanks in Z10.1 and Z10.4.

5. Means of access from longitudinal permanent means of access within each bay to rafts

GPG reviewed the proposal that the following text be added to Z10s:

A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay.
(Technical Background: for the safety of surveyors)

There may be ships which are arranged in accordance with para b, page 8 of the Annex to the current SC 191 (i.e., no means of access from the LPMA in each bay to a raft is required) and therefore could not be rafted if the sentence proposed by RINA("A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay") is included in the Z10's.
GPG therefore agreed not to include this sentence in Z10s.

For the same reason, the same sentence was not added to Rec.39.

Finally, GPG added the following sentence to UI SC191(interpretation for II-1/3-6):

> *A permanent means of access from the longitudinal platform to the water level indicated above is to be fitted in each bay (e.g permanent rungs on one of the deck webs inboard of the longitudinal permanent platform).*

6. Implementation

It was agreed that the revised UI SC191 be implemented to ships contracted for construction 6 months after adoption by Council.

UI SC191 was also edited in line with IMO MSC/Circular. 1176, leaving its mandatory language (is/are to, shall) unchanged.

(Note: UI SC191(Rev.2) makes references to the following new Recommendations:
- REC 90: Ship Structure Access Manual
- REC 91: Guidelines for approval/acceptance of Alternative Means of Access)

23 September 2005
Permanent Secretariat
Updated on 13 Oct 2005.

Survey Panel Task 11 – Unified Periodic Survey Requirements related to SOLAS Reg. XII/12 & Reg. XII/13.

Technical Background
Amendments to UR Z10.2(Rev.19, Jan 2006) and UR Z10.5 (Rev.3, Jan 2006)

1. **Objective**

To amend UR 10.2 Section 2.6 and 3.4 and UR Z10.5 Section 2.6 and 3.3 to include survey requirements related to SOLAS reg. XII/12 and XII/13.

2. **Background**

This task was originally discussed during the WP/SRC annual meeting which took place at DNV Headquarters on the 26th to 28th October 2004; it was subsequently recorded under paragraph 9 "any other business" of the minutes of this meeting.
While the SOLAS Reg.XII/12 (hold, ballast and dry spaces water level detectors) and XII/13 (availability of pumping systems) retroactive requirements for existing bulk carriers have entered into force on 1st July 2004, as required by IMO Res.MSC.134(76), the IACS UR S 24 has been deleted on 1st January 2004.In addition, SOLAS does not include any periodical survey requirements for such detection systems and pumping systems.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel member from BV raised this issue at the February 2005 Survey Panel meeting and volunteered to propose amendments to the applicable URs for Panel members to review and comment on through correspondence. At the Fall meeting of the Survey Panel, it was agreed upon by all Panel members that the proposed amendments for UR Z10.2 and Z10.5 as applicable, which were proposed by BV were acceptable.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Submitted by Survey Panel Chairman
4 Nov 2005
approved on 31 Jan 2006 (5031fICa)

Survey Panel Task 43 – Amend the applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

Technical Background

(UR Z10.2, Rev.22, June 2006)
(UR Z10.4, Rev.4, June 2006)
(UR Z10.5, Rev.4, June 2006)

1. **Objective**

Amend applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

2. **Background**

Due to the different application of substantial corrosion in the CSR from the current Unified Requirements.

3. **Methodology of Work**

Panel members discussed the proposed revisions through correspondence up to the Spring Panel meeting where final amendments were agreed upon for submittal to the IACS Hull Panel for review.

4. **Discussion**

After much discussion between all Panel members at the March 2006 Survey Panel members, a unanimous decision was reached as to the wording of CSR Substantial corrosion in UR Z10.2, 10.4, and 10.5 in section 1.2.9 and was then submitted to the Hull Panel for review and approval. The hull panel concluded that the Survey Panel definition for CSR substantial corrosion was not entirely accurate and recommended further amendments to clarify the actual requirements. The new definition was then circulated to the Survey Panel for a final review and was unanimously agreed upon.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules/procedures. Assuming that GPG and Council approve the amendments, the Survey Panel would propose **July 2007 as** an implementation date.

Submitted by Survey Panel Chairman

Technical Background

UR Z10.1 (Rev.14), UR Z10.2 (Rev.23), UR Z10.4 (Rev.5) & UR Z10.5 (Rev.5)

Survey Panel Task 3 – Maintenance of Alignment/ Compatibility of IACS URs and IMO survey requirements

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements regarding resolution MSC 197(80) – amendments to A744(18)

2. **Background**

IMO survey requirements to ESP vessels as amended in A744(18) as noted in MSC 197(80), with an implementation date of 1 January 2007.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel members, at the fall 2006 Survey Panel meeting, finalized the amendments to the applicable URs due to changes adopted at MSC(80).
Additionally, Members noted that URZ10.4 paragraphs 2.2.3.1 and 4.2.2.2 does not require examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80). The survey panel agreed that if this is the position that IACS would like to take regarding double hull tankers, then it should be brought to the attention of IMO at the next IMO meeting, DE50 in March 2007.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve the amendments, the Survey Panel would propose January 2008 as an implementation date, although the IMO implementation date is January 2007.

Submitted by Survey Panel Chairman
9 January 2007

GPG discussion

All members agreed to omit the requirement of examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80), from URZ10.4 for double hull tankers and

that it should be brought to the attention of IMO at DE50. In addition ABS proposed that paragraphs relating to similar requirements in URZ10.1 should also be deleted for consistency and this was agreed by members.

Members also made a number of minor/editorial corrections to the text prior to their approval of the revised documents.

Added by Permanent Secretariat
23 April 2007

Technical Background Document

UR Z10.5 (Rev.6 April 2007) & UR Z10.2 (Rev.24 April 2007)

(Survey Panel Task 10 – Develop survey requirements for void spaces of ore carriers)

1. Objective:
Develop survey requirements for void spaces of ore carriers

2. Background
DNV requested at WP/SRC Annual meeting October 2004 to develop survey requirements void spaces of ore carriers. See the attached document « Ore Carriers, Hull Survey Requirements » for easy reference.
NK submitted a « A case study on a certain Ore Carrier » dated 22 October 2004 for this purpose.

3. Discussion
The task has been carried out by a Project Team chaired by DNV Survey Panel member and with Survey Panel members from BV, LR, NK and RINA.

The Project Team drafted new amendments to Unified Requirement UR Z 10.5 « Hull Surveys of Double Skin Bulk Carriers » using the same principles contained in the survey requirements of UR Z10.1 for ballast spaces of single hull oil tankers with appropriate adjustments recognizing that void spaces do not carry ballast water.

In that respect, a new TABLE I/Sheet 2 was developed to cover the minimum requirements for close-up surveys at special hull surveys of ore carriers. The existing TABLE I, renamed TABLE I/Sheet 1, was made applicable to double skin bulk carriers excluding ore carriers.

Accordingly, TABLE III/Sheet 3 (REQUIREMENTS FOR EXTENT OF THICKNESS MEASUREMENTS AT THOSE AREAS OF SUBSTANTIAL CORROSION OF DOUBLE SKIN BULK CARRIERS WITHIN THE CARGO LENGTH AREA) was renamed STRUCTURE IN DOUBLE SIDE SPACES OF DOUBLE SKIN BULK CARRIERS INCLUDING WING VOID SPACES OF ORE CARRIERS.

In addition, Sheets 15 and 16 of URZ10.2 Annex II are to be removed.

The draft amendments to UR Z10.5 were presented to the Survey Panel members on the 13th-15th September 2006 meeting at ABS Headquarters in Houston and were finally agreed by all members on the 22nd September 2006.

4. Implementation
The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class Rules/procedures. Assuming that GPG and Council approve the amendments by the end of 2006, the Survey Panel would propose as an implementation date for surveys commenced on or after the **1 July 2008**

Submitted by Survey Panel Chairman
22nd March 2007

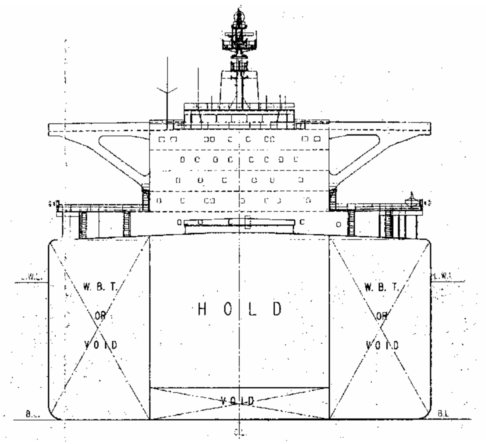
<u>Permsec note (May 2007):</u>
Revisions adopted by GPG 12 April 2007 (5031hIGg).

Attachment:

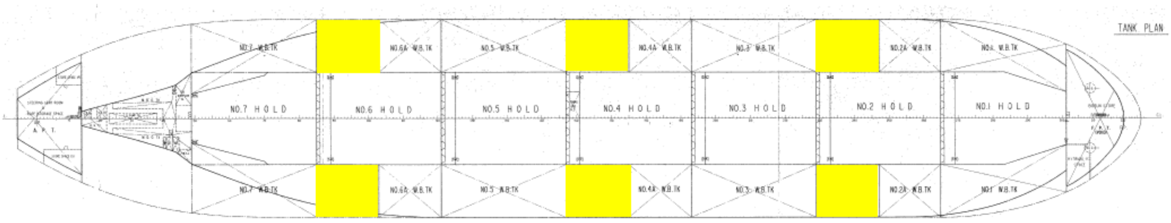
Ore Carriers, Hull Survey Requirements

"Ore carrier" means a single deck ship having two longitudinal bulkheads and a double bottom throughout the cargo region and intended for the carriage of ore cargoes in the centre holds only. Side tanks are generally arranged for the carriage of water ballast.

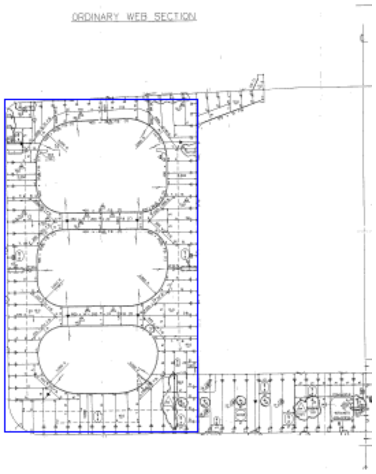
In accordance with UR Z10.5, for close-up surveys of side ballast tanks of ore carriers, the survey requirements of side ballast tanks for oil tankers as given in UR Z10.1 apply.



However, the amount of ballast water required to meet draught requirements for navigation / harbour operations, are generally less than the total capacity of the side tanks.
Hence ore carriers are often designed with several side tanks as void spaces.



The internal structures are generally as for side ballast tanks with transverse web frame rings. The protective coating, if any, may be less durable than coating applied for ballast tanks and the void spaces are exposed to corrosion.



Ore carriers are generally large sized vessels and the overall survey of side void spaces may not be sufficient in order to carry out a meaningful survey for detection of corrosion and other structural defects.

It is proposed to consider minimum requirements for close-up surveys for side void spaces. Requirements given in UR Z10.1 applicable to side cargo tanks may be used as basis.

DNV 2004-10-19

Technical Background

UR Z10.5, Rev. 7 (July 2007) - Amendment to Table II

Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements.

2. **Background**

This proposed change was raised by the DNV Survey Panel member due to inconsistencies found in the UR Z10s.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

The DNV Survey Panel members raised the issue of alignment of TM requirements for vessels falling under the Z10s, where at Renewal Survey#2, TM was required for selected wind and water strakes outside the cargo area, except for vessels under UR Z10.5.
All Survey Panel members agreed to the inconsistency and further agreed to the proposed changes.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose July 2008 as an implementation date.

Submitted by Survey Panel Chairman,
25 June 2007

Permanent Secretariat note (July 2007):
Adopted by GPG with an implementation date of 1 July 2008 on 14 July 2007 (ref. 7596_IGb).

Technical Background

URs Z7(Rev.15), Z7.1(Rev.5), Z7.2(Rev.1), Z10.1(Rev.15), Z10.2(Rev.26), Z10.3(Rev. 9), Z10.4(Rev.6), Z10.5(Rev.8) – November 2007

Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions

1. Objective

To review IACS Resolutions annually and discuss or propose amendments as deemed necessary.

2. Background

This proposed amendment to all URZ7s and URZ 10s was raised by the Panel member from DNV due to Owners crediting tanks concurrently under intermediate and special survey.

3. Methodology of Work

Survey Panel members through correspondence.

4. Discussion

The Panel member from DNV raised the issue of Owners having the ability of crediting spaces and thickness measurements only once in a 54 month interval, due to the availability of concurrent crediting of spaces and thickness measurements due to the flexible time window that is currently allowed between the intermediate survey and the special survey.
After a presentation and discussion lead by the DNV Panel member, all Survey Panel members agreed to the argument given by DNV, and further agreed to make the necessary changes in all URZ7s and URZ10s where Owners are not allowed to concurrently credit surveys and thickness measurements of spaces.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG approve to the amendments, the Survey Panel would propose January 2009 as an implementation date.

Submitted by Survey Panel Chairman
22 October 2007

Permanent Secretariat note (December 2007):

During GPG discussion DNV proposed that *"since this matter will be discussed between Owner and Class mainly in connection with the forthcoming Special Survey, DNV would prefer to locate this text, not only as part of Intermediate Survey, but also as a new text for the Special Survey."* This was supported by BV, ABS, RINA and KR.

The revised documents were approved, with DNV's proposal and an implementation date of 1 January 2009, on 15 November 2007 (ref. 7690_IGb).

Technical Background

URs Z7(Rev.16), Z7.1(Rev.6), Z7.2(Rev.2), Z10.1(Rev.16), Z10.2(Rev.27), Z10.3(Rev.11), Z10.4(Rev.7) and Z10.5(Rev.9) - March 2009

Survey Panel Task 62:

A) Harmonization of UR Z10.1, Z10.2, Z10.4 and Z10.5 with UR Z10.3 with respect to items 5.5.4.4 and 5.6.2.

B) Harmonization of UR Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 with UR Z7.2 with respect to the definition of the corrosion prevention system and with respect to the footnote 1 related to semi-hard coatings.

C) Harmonization of the definition of Ballast Tank in UR Z7(Rev.14)

1. Objective

A) Amend the texts of items 5.5.4.4 and 5.6.2 in Unified Requirements Z10.1, Z10.2, Z10.4 and Z10.5 in order to align them with those in UR Z10.3, in which they were changed while performing Task 55, whereas in the other UR Z10s they were kept unchanged on the grounds that this change was out of the scope of Task 55.

B) Amend the definition of “Corrosion Prevention System” and include a Footnote 1 related to semi-hard coatings in Unified Requirements Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 in order to align them with those adopted in UR Z7.2, when this new UR was issued.

C) Amend UR Z7 (Rev. 14) in all items where the term “Ballast Tank” is used in order to get them harmonized with the definition itself.

2. Background

The task, as regards item A), was triggered by a Member Society, while performing Task 55, on the grounds that this part was out of the scope of the task and then should have been dealt with in a separate task.
The task, as regards item B), was triggered as a consequence of the “New Business action item 2” of the Minutes of the September 2008 Survey Panel meting, for sake of harmonization of the various URZs.
The task, as regards item C), was triggered as a consequence of the “Task 54-Examination of Double Bottom Ballast Tanks at annual surveys” of the Minutes of March 2008 Survey Panel meeting, for sake of harmonization of the definition of Ballast Tank in UR Z7(Rev.14).

3. Discussion

The task was carried out by correspondence. All the amended texts for the affected URs were prepared by the Survey Panel Member who had chaired the PT on Task 55, in accordance with the Form A approved by GPG. In addition to the objectives outlined in the Form A, an amendment was added to item 1.3.1 of UR Z10.2 and UR Z10.5 in which the reference 3.2.3.6 in the last item of the list was replaced by 3.2.3.10 as can be correctly verified in the text.
The amended URs were circulated to all Survey Panel Members for review, comments and agreement. The texts of the URs were unanimously agreed by all Members.

4. Implementation

The Survey Panel is of the view that the Member Societies need at least 12 months from the adoption date to implement these amendments into their class rules/procedures. Therefore, in the first version of all amended URs the following implementation sentence should be proposed:

Changes introduced in Rev .xx are to be uniformly applied by Member Societies and Associates for surveys commenced on or after [not less than 12 months after the adoption by GPG/Council].

Since it is common practice and convenience to have implementation dates either on 1st January or on 1st July of the year, the Survey Panel proposes the 1st July 2010 as implementation date, if GPG/Council approve the URs not later than 30 June 2009.

Submitted by Survey Panel Chairman
28 February 2009

Permanent Secretariat notes (April 2009):

1. The amended URs were approved by GPG on 18 March 2009 (ref. 7718bIGd).
2. During the typesetting process it was noted that para 5.1.5 of UR 7.2 was inconsistent with the amended URs and so following consultation with the Survey Panel this was also amended at this time.
3. Regarding the implementation date, GPG agreed to use 1st July 2010 provided that it was consistently used for the amended URs.

Technical Background for UR Z10.5 Rev.10 (Mar 2011)

1. Scope and objectives

1) To amend UR Z10.4 to harmonize the definition of transverse section.

2) Update of references in the Executive Hull Summary Table IX.

3) Review IACS URZ10.5 to determine if there are issues which need to be addressed to ensure that the IACS survey regime and the CSRs are compatible.

2. Engineering background for technical basis and rationale

1) Based on that fact that bulk carriers and oil tankers have a transverse framing system applied for example on ship's sides etc. and that UR Z7 is applied to all types of ships and includes an extended definition of transverse section it is necessary to unify this definition in UR Z10s.

2) Update of references in the Executive Hull Summary Table VII such that the introduction of extended annual surveys is noted in the 'Memoranda' section rather than under 'Conditions of Class'.

3) Some requirements in CSRs for Bulk Carriers were relevant to ships in operation and it was decided to move them from CSRs to UR 10.5 in more consistent way.

3. Source / derivation of the proposed IACS Resolution

CSR, IACS UR Z7.
Proposed amendments to UR Z10.5 are based on internal discussion of IACS which is always striving to produce consistent and compatible rule requirements.

4. Summary of Changes intended for the revised Resolution:

1) The following additional text is added to the definition of transverse section in para 1.2.6:

   "For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections."

2) In the Executive Hull Summary Table VII (iv) the reference to part G) is updated to part H) as per Table VII (ii).

3) The main amendment has consisted in removing the requirements found in the CSRs related to surveys after construction and locating them in the applicable sections of UR Z10.5. The rationale of that is to have only one place where survey requirements are given and avoid any duplication of requirements in different documents, which would give rise to problems of maintenance and alignment.

   Another important amendment has been the requirement for annual examination of the identified substantial corrosion areas for bulk carriers. One Member Society was of the opinion that there should be no difference between the CSRs and non-CSRs bulk carriers. The other Member Societies were of the opinion to consider an alternative examination, which was the original requirement in CSRs, and thus the following text was adopted in UR Z10.5:

"For vessel built under IACS Common Structural Rules, the identified substantial corrosion areas may be:
a) protected by coating applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in good condition, or alternatively
b) required to be gauged at annual intervals."

Other important amendments have been made moving the following items from the CSRs to Z10.5 as applicable:
a) the paragraphs regarding the different corrosion patterns, such as pitting corrosion, edge corrosion and grooving corrosion, and their different acceptance criteria,
b) the items regarding the number and locations of thickness measurements, together with the associated table and referenced figures.

Another notable change has been introduced in the "ANNEX II - Recommended Procedures for Thickness Measurements" of UR Z10.5, which, however, are only recommendatory and not mandatory, where thickness measurements forms specific to CSRs double skin bulk carriers have been produced in addition to the existing ones, which only apply to non-CSRs ships.

Finally, for CSRs bulk carriers the requirement has been introduced which stipulates that "the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the special surveys carried out after the ship reached 15 years of age (or during the special survey no. 3, if this is carried out before the ship reaches 15 years) in accordance with the criteria for longitudinal strength of the ship's hull girder for CSRs bulk carriers specified in Ch 13 of CSRs".

5. Points of discussions or possible discussions

See item 4 above.

6. Attachments if any

None.

Technical Background for UR Z10.5 Rev.11, July 2011

1. Scope and objectives

Review the requirement for repairs within IACS UR 7 and UR 10 series, in particular the requirement for Prompt and Thorough Repair, with a view to developing wording that would permit a temporary repair and the imposition of a Recommendation/ Condition of Class under specific and controlled circumstances, and in accordance with PR35.

2. Engineering background for technical basis and rationale

There are instances, for example a localised, isolated and very minor hole in a cross-deck strip, at which a suitable temporary repair, for example by welding or doubling, and the imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date, are considered very adequate methodology for dealing with the defect.

Current IACS Requirements in the UR Z7 and Z10 series, for Prompt and Thorough repair, would not permit this to be an option, the defect would have to be permanently Promptly and Thoroughly repaired, which might require removing cargo, moving to a repair berth and staging inner spaces.

Under the Requirements of IACS Procedural Requirement PR 35 the methodology of Temporary Repair and imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date is fully permissible.

3. Source / derivation of the proposed IACS Resolution

Based upon discussion within the IACS Survey Panel.

4. Summary of Changes intended for the revised Resolution:

Following the definition of Prompt and Thorough Repair in the Unified Requirement, a new paragraph is proposed to be added:-

"1.3.3 Where the damage found on structure mentioned in Para. 1.3.1 is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the surveyor to allow an appropriate temporary repair to restore watertight or weather tight integrity and impose a Recommendation/Condition of Class in accordance with IACS PR 35, with a specific time limit."

Also, Table I was split to into 2 tables for enhanced clarity, Table I.1 for Single Skin and Table I.2 for Double skin ships and miscellaneous editorial errors in the Table I.1 and I.2 are corrected.

5. Points of discussions or possible discussions

a) The points of discussion are as indicated in Sections 2 and 4 above.

b) Discussion took place on whether to prepare this amendment as a Unified Interpretation of IMO Resolution A.744(18)/UR Z7 and Z10 series, finally it was agreed to make direct amendment to the relevant URs.
c) It is proposed that this amendment be submitted directly to the IMO DE/MSC Committees for consideration of amending directly IMO Res. A744(18)

Technical Background for UR Z10.5 Rev.12 May 2012

1. Scope and objectives

To clarify the SSH No. 2 requirement of Table I regarding close-up surveys.

2. Engineering background for technical basis and rationale

N/A

3. Source / derivation of the proposed IACS Resolution

N/A

4. Summary of Changes intended for the revised Resolution:

The requirement for close-up surveys at SSH No.2 as contained in Table I was clarified to indicate that close-up survey of the "forward and aft transverse bulkheads including stiffening system in a transverse section including topside, hopper side and double side ballast tanks" only applied to the tanks on one side of the ship. This clarification is consistent with the requirements of IACS Z10.2 for single skin bulk carriers.

5. Points of discussions or possible discussions

None

6. Attachments if any

Technical Background for UR Z10.5 Rev.14, Jan 2014

1. Scope and objectives

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.
b) To align the requirements in PR37 and UR Z10s regarding safe entry to confined spaces.

2. Engineering background for technical basis and rationale

a) As per the IMO Res. A1053 (27), lengthy conversions (not necessarily of major character) or other major repair work can be assigned for a 5 year period from the date of completion of conversion/repairs/surveys.
b) Safety requirements in IACS PR37 can be applied to carry out survey in safe way for all kind of ships. When there are no indications about the safety of surveyor in UR Z10s then the requirements in PR37 shall be applied.

3. Source/derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

a) Following additional text was included to section 2.1.3 to clarify the class period for lengthy conversions

"In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date."

b) Existing Section 5.2.6 and 5.2.7 were deleted from UR Z10s since provisions of these sections were covered by PR37. Reference of PR37 was included in Section 5.2.1.1.

5. Points of discussions or possible discussions

i) Additional text to Para.2.1.3 was discussed in order to clarify class period.
ii) Panel considered that safety of surveyors should be dealt by PR37.

6. Attachments if any

None

UR Z10.5 (New, November 2003, Correction Jan 2004)

Technical background

1. Objective

WP/SRC to develop a new UR for Hull Surveys of Double Side Skin Bulk Carriers

2. Points of discussion

2.1 In 1999, GPG identified a need to develop a UR (or amend Z10.2) applicable to double side skin bulk carriers.

WP/SRC was so tasked to develop a UR tailored to the structural configuration of double hull bulk carriers and other features which distinguish double hull bulk carriers from single skin bulk carriers. The UR, when developed, would be submitted to IMO for incorporation in future amendments to A.744(18).

2.2 GPG, after the first round of the draft UR in 2003, then tasked WP/SRC to further consider the definition of bulk carriers, how to treat bulk carriers with hybrid cargo hold arrangements, survey requirements for wing ballast tanks of ore carriers (WP/SRC Task 113).

2.3 Taking into account the draft definitions of bulk carrier, single side skin bulk carrier, double side skin bulk carrier as developed at IMO MSC 77 (MSC 77/WP.13/Annex 2), GPG agreed to the definition as proposed by WP/SRC (Z10.5.1.2.1). Ore carriers are included.

2.4 GPG agreed that for bulk carriers with hybrid cargo hold arrangements, Z10.2 apply to cargo holds of single side skin(Z10.5.1.1.2).

2.5 For close-up surveys of wing ballast tanks of ore carriers, Z10.1 Table 1 (for oil tankers) shall apply (Z10.5.2.3.3).

2.6 Rafting requirements in 5.5.5 -5.5.7 are aligned with other UR Z10s.

***

Correction (2212_IGi, 26 January 2004)

2.7 WP/SRC Small Group identified inconsistency between UR Z10.2 and UR Z10.5 and proposed modifications. In Z10.2, the extent of the intermediate survey of ships between 10-15 years is to be equivalent to the previous special survey. Accordingly, the 2nd column of Table IV for intermediate survey requirements also needs to be replaced by "the requirements of the previous special survey".

1) UR Z10.2(Rev.15, Dec 2003) 4.2.3 reads that *for BCs 10-15 years of age, IS shall be the same extent of the previous SS*.
2) The current version of Z10.5 for double skin bulk carriers does not have this requirement.
3) Also, the draft UR Z10.1 (definition of POOR , draft Rev.12 – 3095_IGc of 08/08/2003) contains the same requirement for IS of oil tankers 10-15 years.
4) Z10.5.2.3.3 clearly defines the extent of overall and close-up surveys at the time of Special Surveys.
5) To keep consistency between Z10.2 and Z10.5, paras 4.2.3.1-4.2.3.3 are corrected.

*****

WP/SRC Task 102
HARMONIZATION OF UR Z7s AND Z10s

Technical Background
UR Z7 (Rev. 11)
UR Z7.1 (Rev. 2)
UR Z10.1 (Rev. 12)
UR Z10.2 (Rev. 17)
UR Z10.3 (Rev. 7)
UR Z10.4 (Rev. 2)
UR Z10.5 (Rev. 1)

Contents:

1. Objective

To amend UR Z7s and Z10s in order to make the texts of the above-mentioned URs consistent eliminating all the differences both in substance and in wording (WP/SRC Task 102).

2. Background

In the process of approving UR Z10.4, GPG found it necessary to amend the other existing URs Z10.1, Z10.2, Z10.3, Z10.6 and Z7 in order to eliminate any inconsistencies existing among them.

3. Methodology of work

The WP has progressed its work through many sessions, both during the periodical meetings and dedicated meetings restricted to a Small Group of Members (BV, DNV, GL, LR, RINA) who developed the work in order to be more efficient. All the proposed amendments of the Small Group have regularly been circulated to all Members for comment and agreement.

4. Discussion

4.1 The WP/SRC has completed a comprehensive comparative review of UR Z7 and Z10s, and identified inconsistencies which existed among them. During this review, attention was given to the severity of the requirements applicable to the same spaces/structural areas on different types of ESP ships. As a result, the inconsistencies were eliminated making the URZs harmonized. However, there has been no change to the scope and extent of the survey requirements.

4.2 The starting point for each UR was the most updated version available at the time of commencement. Any revision to the URZs, which were introduced during this task, was taken into account. As for instance, the UR Z10.1 was initially amended based on Rev. 9, while the last amendments are based on Rev. 11 and the UR Z10.2 was initially amended based on Rev. 13, while the last amendments are based on Rev. 16. The proposed revisions of URs Z10.1 and Z10.4 have not been numbered, as there will be revisions to those URs before the revisions introduced by the Task 102 are adopted. In fact, GPG is currently developing a Revision 12 of Z10.1 with the view to introducing significant improvements in the survey regime for ballast tanks (including combined cargo/ballast tanks) of oil tankers and UR Z10s applicable to oil tankers will also have to be revised by incorporating the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005 (see 4.3 below).

4.3 Also, in harmonizing UR Z10.1 and Z10.2 care has been taken to align the corresponding text with that of IMO Res. A.744(18). However, it has been noted that the amendments to A.744(18) contained in Resolution MSC 144(77), which enter into force 1 January 2005, have not been incorporated into the IACS UR Z10s applicable to oil tankers. It seems that the updating of the above-said UR Z10s will be done by the Perm Sec and reviewed by the WP/SRC Chairman and then circulated for adoption by GPG with concurrence of Council Members for uniform application from 1 January 2005. It is understood that the revisions of the UR Z10s affected by those amendments will not include the changes introduced by the Task 102, as the implementation date proposed for those changes is 1 January 2006 (see below **6. Implementation**).

4.4 In the course of the work the WP has been developing for more than two years, several additional Tasks were assigned to the WP by GPG which affected the development of Task 102. The additional tasks which have been taken into account are the following:

1) In the course of Council discussion on UR Z10.6 (General Cargo Ships), certain inconsistencies were identified between Z10.6 and other Z10s. WP was instructed to expedite Task 102 (1060gIAa, 12 June 2002);
2) WP was instructed to include “Survey Planning for Intermediate Survey” into harmonization work (2108_IAa, 12 July 2002);
3) GPG instructed WP to consider whether Z10.6 should be re-assigned as Z7.1, in connection with the harmonization work. 1060gIAb, 20 Sept 2002.

Z7.1 developed;

4) Partial outcome (Z7 and Z7.1) was submitted to GPG on 17 July 2003(1060g). Council decided that approval of Z7(Rev.10) and Z7.1(Rev.2) is postponed until the harmonization is completed (1060gICb, 6 April 2004); Council Chairman instructed WP/SRC to Members' comments on the draft revision of UR Z7 and Z7.1 (collected under s/n 1060g, 1060gNKi (30/03/2004) in particular) on 6 April 2004.

5) GPG tasked WP to include the amendments to Z10.2 / Z11 (BCs with hybrid cargo hold arrangements), deleting sheets 15 and 16 for ore carriers, into the harmonized UR Z10s (2212aIGa, 19 Jan 2004);
6) GPG tasked WP to consider whether the requirements relevant to examination of Fuel Oil Tanks in the cargo area at each Special Survey should be put into Z 10s, and internal examination of FOT at Intermediate Survey after SS 2 is needed. (1060gIAf, 30 Jan 2004);
7) GPG tasked WP to harmonize tank testing requirements in Z7s and Z10s. (3006lIAa, 5 April 2004);
8) GPG tasked WP with Task 108 - Develop uniform survey requirements for air vent pipes including the welded connection to deck. Z22 developed. GPG instructed WP to incorporate Z22 into the harmonized Z10s;
9) GPG tasked WP with Task 114 - Verification and signature of TM reports. REC 77(Rev.1) developed and approved on 29 July 2004. Council approved parallel amendments to Z7.1 and Z10s (TM Forms included) and instructed WP to incorporate these into the harmonized Z10s:
    - Recommendation No.77 was revised (Rev.1, July 2004);
    - Z7.1 para.6.3.2 and Z10s para.7.3.2 so amended.
    - "Surveyor's signature" is deleted from all TM Forms in Z10s;
    - A note is added to Annex II(Z10s) declaring that Annex II is recommendatory.

   WP/SRC's investigation into Members' practice in dealing with verification and signature of TM reports is annexed for record keeping purpose. See Annex 2.

10) GPG tasked WP to consider the BV comments on "TM may be dispensed with…." and include the findings into the harmonized Z10s (2219iIAa, 7 April 2004).

5. Agreement within the WP/SRC

All Members have unanimously agreed the attached final versions of UR's.

6. Implementation

WP/SRC is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming Council adoption in December 2004, WP/SRC would propose January 2006 as implementation date.

Annex 1: TB for UR Z10.1(Rev.12, C49 amendments, see Permsec's note 1 below)
Annex 2: WP/SRC Task 114, verification and signature of TM reports(see 9 above).
Annex 3**:** TB for revision of UR Zs concerning "anodes".

Note by the Permanent Secretariat

1. Annex 1 to this TB contains background for amendments to UR Z 10.1(Rev.12) relating to FAIR/POOR/GOOD (C49 amendments). Council at its 49th meeting (June 2004) agreed/decided that comparable changes should be added to Z10.3 and Z10.4.

2. Appendix 3 "TM sampling method" has been added to UR Z10.1 and Z10.4 to keep them consistent with IMO Res.MSC.144(77). The amendments to A.744 contained in MSC.144(77) entered into force on 1 January 2005. *(GPG s/n 4181)*

Under s/n 4072g, paragraph **2.4.6** of UR Z10.1 and **2.4.6** and of UR Z10.4 (paragraph numbering is now harmonized) were amended in order to provide a link between the main text of the UR Z10.1 and 10.4 and the new Annex III Appendix 3 containing the MSC Res.144(77).

Further, it was agreed that the requirements for evaluation of longitudinal strength of the hull girder (as written in MSC.144(77)) should not be required for Intermediate Survey unless deemed necessary by the attending Surveyor. This is covered in 4.2.3.1 and 4.2.4.1 of Z10.1 and Z10.4.

3. GPG agreed that the amended UR Zs should be implemented from 1 July 2006 altogether.

4. DNV's proposed amendments to UR Z10.1, Z10.3 and Z10.4 concerning annual survey of ballast tanks were agreed by Council (1060gICq, 27 June 2005). See Appendix 2 to Annex 1.

5. Annex 3 contains a TB for revision of UR Zs concerning "anodes".

Date: September 2004
Prepared by the WP/SRC

– – –

Annex 1 to Technical Background
UR Z 10.1 (Rev.12, C49 amendments(coating-related))

1. Objective

To introduce significant improvements in the survey regime for ballast tanks (including combined/ballast tanks) of oil tankers as matter of strategic concern and urgency to IACS, given the aging of both the single and double hull tanker fleets and the problems encountered with corrosion of ballast tanks in several shipping casualties.

2. Background

Draft amendments to UR Z10.1 were submitted to Council 47 (June 2003) and agreed in principle.

3. Discussion

There was particular concern over accelerated corrosion with age (as the thinner the material, the more rapidly the allowable diminution margin percentage disappears) especially where coatings have broken down. There is also a disincentive for any spend on maintenance of the structure of a ship within a few years of its statutory scrapping date.

Council discussion by correspondence had evolved to the position of substantive proposals – summed as follows (3095_ABa, 2 June 2003):

1. Enhance the Intermediate Survey in Z10.1, Z10.3 and 10.4 for Tankers after 2nd Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey). This corresponds to the latest revision to UR Z10.2.
2. At Annual Survey of ballast tanks with substantial corrosion, the overall survey is to be replaced by close-up survey with thickness measurements of the exposed area.
3. Proposed to task WP/SRC to re-consider the acceptance criteria for the rating FAIR further. For this, eliminate FAIR, leaving only GOOD and POOR redefined as appropriate.
4. Proposed to task WP/SRC to explicitly require close-up survey of Suspect Areas identified at the previous Special Survey.

Council 47 discussed the proposals(June 2003) as follows:

1. Definition of FAIR

   Council 47 agreed that "FAIR" would be retained as a rating and that GPG should instruct WP/SRC to redefine FAIR, so that there would be a clear differences between FAIR, POOR and GOOD. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have the same scope as Special Survey No.2(Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

   Based on the strong majority, Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

   > *DNV and NK stated that they could not accept a requirement for annual surveys of ballast tanks when the coating condition is less*

than GOOD and proposed that GOOD be changed to FAIR (3095_IGc, 30 June 2003)

2. ABS' proposed amendments to Z10.1(annual examination of BWTs in certain conditions) were approved.
3. C 47 agreed that the BWT coating requirements (Z10.1.2.2.3) for intermediate Survey after SS 2 should be the same extent to the previous SS.
4. Given the substance of the changes, the revised Z10.1 should be shown to Industry before adoption.
5. A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.

Following Council 47, the draft text of Z10.1(Rev.12) was distributed to Industry and discussed at the IACS/Industry meeting on 29 August 2003. Industry indicated that UR Z10.1(Rev.12) is acceptable, provided that appropriate IACS guidelines on coating repairs are developed.

The Small Group on Coating (SG/Coating) under WP/SRC prepared draft guidelines on coating repairs and considered the definitions of GOOD / FAIR / POOR. The SG/Coating did not change the definitions and found that the Guidelines provide useful clarifications on the definitions and criteria in achieving an industry wide uniform judgement of coating conditions as well as what is needed to restore GOOD conditions.
Further, an IACS/Industry JWG/Corrosion was established and met in February 2004. The outcome is (3095_IGh, 4 June 2004):

- Draft Guidelines on Coating Repair (IACS REC 87)
- Draft UR Zxx (mandatory coating of cargo tanks on oil tankers)
- Draft UI SC 122 (Rev.2) – mandatory coating of ballast tanks

4. Others

1. Z10.11.2.2bis - Definition of "Combined Cargo/Ballast Tank. …as a routine part of the vessel's operation and will be treated as a Ballast Tank. ...". By so amending, Z10s do not need to repeat "Ballast Tanks *and Combined cargo/salt water Ballast Tanks*" in addressing the ballast tanks. Hence, all the references to "*and Combined cargo/salt water Ballast Tanks"* were deleted.
2. Z10.1.2.2.1.2: The aim of the examination is ~~to be sufficient~~ to discover substantial corrosion…
   Comparable changes are to be added to other UR Zs wherever the same sentence occurs.
3. "IACS Guidelines for Coating Maintenance & Repairs for Ballast Tanks and Combined/Ballast tanks on Oil Tankers" are referenced where relevant.
4. Comparable changes are to be added to UR Z10.3 and Z10.4, after adoption of Z10.1(Rev.12).

Attached: Memo on Coating Matters (GPG Chairman)

9 June 2004
Prepared by the Permsec

Appendix 1 to Annex 1: MEMO on Coating matters

1. Background and discussion within IACS on UR Z10.1 (draft Rev.12) between 29/01/03 and 14/08/03

In view of the survey experience with oil tankers, it was proposed that all ballast tanks should be examined, routinely and uniformly, at annual surveys on ESP tankers exceeding 15 years of age. IACS should amend UR Z10.1 to require the examination of ballast tanks on such ships at each annual survey. This is simple, clear and thorough and not subject to interpretation. (2242_ABq dated 29/1/03)

Then, ABS modified the proposal asking, for tankers subject to URs Z10.1, Z10.3 and Z10.4, exceeding 15 years of age, that the current requirement - pertaining to annual examination of Ballast Tanks adjacent to cargo tanks with any means of heating - be deleted and replaced by a simpler and more stringent requirement that all Ballast Tanks be subject to survey at each subsequent annual survey where either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and the protective coating is not renewed at special survey or intermediate survey. This will ensure that all Ballast Tanks with substantial corrosion or protective coating which is not in GOOD condition at the time of special survey or intermediate survey will be examined at each subsequent annual survey on tankers exceeding 15 years of age. (2242_ABzb dated 14/3/03)
This was later expanded to include all tanks used routinely for ballast water, both ballast-only and cargo/ballast tanks (2242_ABzc dated 14/3/03).

ABS further reviewed the issue of the survey of salt water ballast spaces and combined cargo/salt water ballast spaces with ABS' governing bodies in light of recent casualties and survey findings on other tankers. Their review found an increasing amount of coating breakdown/failure and subsequent rapid wastage in key structures after Special Survey No. 2, i.e. after 10 years of age. These conditions are most prevalent in the under deck structure and the side shell structure in way of the deep loadline. In a number of cases the serious wastage has caused fracturing of the under deck longitudinals and in some cases fracturing has extended to the main deck structure. This led ABS to refine proposed amendments to URs Z10.1, Z10.3 and Z10.4 to require (2242_ABzf dated 9/5/03):

a. For Tankers exceeding 10 years of age

> Salt Water Ballast Spaces and Combined Cargo/Salt Water Ballast Spaces. For tankers exceeding 10 years of age, salt water ballast spaces and combined cargo/salt water ballast spaces are to be internally examined at each subsequent Annual Survey where substantial corrosion is found within the tank or where the protective coating is found to be less than GOOD condition and protective coating is not repaired. Internal examination to be an Overall Survey.

b. For Tankers exceeding 15 years of age:

Salt Water Ballast Spaces and Combined Cargo/Ballast Spaces. For tankers exceeding 15 years of age, salt water ballast spaces and combined cargo/ballast spaces are to be examined internally at each subsequent Annual Survey. Where substantial corrosion is found within the tank, or where the protective coating is found to be in less than GOOD condition and the protective coating is not repaired then in addition to an Overall Survey, under deck structure and the side shell structure in way of the deep loadline is to be subject to Close-up Survey.

NK and BV replied that the proposed amendments made by ABS need to be substantiated in a transparent manner with technical data that ABS may possess and put forward for further assessment and discussion. (2242_NKn dated 14/5/03 and 2242_BVz dated 16/5/03)

DNV (2242_NVn dated 2/6/03), having carefully considered the practical consequences of taking the ship off-hire for gas freeing etc. and being concerned about the difficulties to have these surveys executed in a safe manner and whether the intended safety benefits in implementing the proposed extended scope of the annual survey of Ballast tanks will be met, **proposed the following alternative measures** which would be as effective and may not have such delaying effects to the ship:

1) Enhance the Intermediate Survey in UR Z10.1, 10.3, and 10.4 for Tankers after the 2 Special / Renewal Survey to the same level (scope of work) as the preceding Special / Renewal Survey. (This will correspond to the latest revised requirements of UR Z10.2 for Bulk Carriers.)
2) At Annual Survey of ballast tanks with substantial corrosion the overall survey should be replaced by close up survey with thickness measurements of the exposed area. (An overall survey of these tanks does not give sufficient information of the development of the areas with substantial corrosion.)
3) Further we will not fail to mention that the WP/SRC has proposed to extend the close up survey in cargo and combination tanks to 30% from the 3 Special / Renewal Surveys.
4) **Experience has shown that the coating condition rating category FAIR has a tendency to be stretched too far into the POOR condition. We will therefore propose that we task the WP/SRC to reconsider the acceptance criteria for the rating FAIR further.**
5) We do also question the need for redefining the definition of combination tanks, particularly since the category I tankers which are the ships that normally are fitted with these type of tanks are to be phased out 2 to 4 years from now. However DNV will not oppose to such a redefinition.

DNV requested Members to consider the above as an alternative to the ABS proposal, bearing in mind that we ought to present this to the industry prior to deciding.

ABS (3095_Aba dated 2/6/03), having further considered its earlier proposals in light of NVn, submitted a revised proposal for consideration by Council at C47 and replied to the above 5 DNV proposals as follows:

1) ABS fully supports this proposal.
2) While ABS agrees with this proposal, it is in fact already provided for in Z7 (3.2.3) and Z10.1 (3.2.5.1)--which require that "Suspect areas (which include any area where substantial corrosion is found) identified at previous Special Survey are to be examined. Areas of substantial corrosion identified at previous special or intermediate survey are to have thickness measurements taken." To us, this implies that close-up survey of these areas is to be done at annual survey in conjunction with the thickness measurements. However, we can

agree to tasking WP/SRC to explicitly require "close-up" survey in this connection and to amend Z7, and all the Z10's, appropriately to make this explicit, if there is majority support for this.

3) We agree that this has been put forward to GPG by WP/SRC via 0237hNVb, 27 May. However, these additional CAS close-up survey requirements do not apply to salt water ballast tanks; only to cargo oil tanks and combined cargo/ballast tanks.
4) **We agree with this assessment and we propose that the only way to eliminate the subjectivity and raise the standard is to eliminate the category "FAIR" completely; leaving only "GOOD" and "POOR" redefined as follows:**
   "GOOD -- condition with no breakdown or rusting or only minor spot rusting.
   POOR -- any condition which is not GOOD condition."
5) ABS does not agree with this proposal. We are particularly concerned that we need a very thorough and robust survey regime for these tankers precisely because they are subject to mandatory phase out over the next several years. We are very concerned that without additional IACS requirements, these tanks will receive little or no inspection and maintenance by owners or others after their last special or intermediate survey, if no substantial corrosion is found at that time. Rapid, localized wastage in way of deteriorating coatings may pose significant hazard if the survey regime is not further tightened as we are proposing.

In conjunction with the above comments on DNV proposals, ABS further considered their previous proposal in ABzf and modified it as follows:

- **ABS simplified the proposal to require annual examination of all salt water Ballast Tanks and combined Cargo/salt water Ballast Tanks irrespective of age, when either substantial corrosion is found within the tank or the protective coating is found to be in less than GOOD condition and is not repaired.**
- the requirement for annual (close-up) examination of salt water ballast tanks and combined tanks is already required in Z10.1 (3.2.5.1). ABS proposed adding it to 2.2.3 for clarity and emphasis so that all the conditions which may lead to annual examination of such tanks are listed together in one place.
- Since the principal problem that we are trying to address is rapid, localized corrosion in way of breakdown or deterioration of the protective coating, we are proposing that the coating condition should be found and kept in "GOOD" condition to obviate the need for annual examination. **The attached proposal is made together with the proposals in items 3.1 (intermediate following Special survey 2 to have same scope as prior Special survey) and 3.4 (eliminating "FAIR" and redefining "POOR" as any condition other than "GOOD" condition.**

ABS requested to decide on a course of action at C47 for tightening the survey regime for tankers. They agreed that industry be informed of Council's decisions in this regard prior to IACS making the decision public, but IACS should maintain its independence and take decisive action in this matter. Debate with industry can only lead to delay and to a watering down and compromising of these important requirements.

NK agreed to task WP/SRC to reconsider the acceptance criteria of "FAIR" for clearly define the border between "FAIR" and "POOR" condition. However, **NK strongly opposed the elimination of "FAIR" coating condition from UR Zs** because this can not resolve to remove subjectivity of coating assessment. The three-categorization system of coating condition should be retained. (3095_NKa dated 5/5/03)

<u>Outcome of C47</u>

At **C47**, it was agreed that “Fair” would be retained as a rating and that GPG should instruct WP/SRC to redefine “Fair”, so that there would be a clear differentiation between “Fair”, “Poor” and “Good”. It was also agreed that for oil tankers the Intermediate Survey following Special Survey No.2 would have same scope as Special Survey No.2 (Z10.1). WP/SRC should also clarify the definition of satisfactory repair.

Based on strong majority support Council agreed to discuss with Industry annual surveys of ballast tanks when coating is found in LESS than GOOD condition at special survey, with the objective to encourage the owner to carry out repairs and maintenance of coating to GOOD condition.

This matter should be discussed with Industry prior to adoption of any UR by Council.

In a final summary, the Chairman proposed that a constructive dialogue with Industry should take place on the IACS proposal as set out in WP1 plus maintaining 3.2.5.2 modified to say that ballast/combined ballast/cargo tanks will be subject to annual survey when considered necessary by surveyors.

After discussion in the JWG (Industry/IACS), GPG should propose final rules for this matter to Council, including acceptable repair definition.

F**UA 17:** *To instruct WP/SRC to develop guidance on coating repairs and more precise definition of “Fair” coating condition.*

Once approved, these requirements should be incorporated into Z10.3 and Z10.4.

FUA 15

1) *To prepare a draft revision to UR Z10.1 incorporating C 47 decisions:*
    - *The definition of “FAIR” remains as it is;*
    - *ABS proposed amendments to Z10.1 (annual examination of BWTs in certain conditions) were approved;*
    - *C47 agreed that the BWT coating requirements (Z10.1.2.2.3) for Intermediate Survey after Special Survey No.2 should be the same extent to the previous Special Survey.*
    - *Given the substance of the changes, the revised UR Z10.1 should be shown to Industry (OCIMG/Intertanko first among others) before adoption for their review and comments.*
    - *A guidance for coating repairs needs to be developed by WP/SRC with reference to TSCF Guidelines.*

2) *GPG Members are to confirm the draft revision to Z10.1 in consultation with their WP/SRC members by correspondence. See 3095_IGa of 13/06/03.*

According to C47 FUA 15, GPG Chairman circulated (3095_IGa dated 13/6/03) draft amendments to UR Z10.1 as agreed in principle at C47.

Having received a number on comments, GPG Chairman (3095_IGb dated 27/6/03) informed that the Council Chairman confirmed that GPG is not to amend the principles agreed at C47, i.e. we are not empowered to change "GOOD" to "FAIR" as proposed by DNV and NK, nor to amend the definitions of "FAIR" and "POOR" as proposed by DNV.

DNV's intention to possibly lodge a reservation was noted, however the matter should be raised at Council and not be dealt with by GPG. An amended draft text incorporating the non-substantive changes proposed by Members was circulated.

DNV said that its understanding was that the draft should be circulated to the Industry (ICS, INTERTANKO, and BIMCO) prior to adoption by Council. (3095_NVc dated 30/6/03)

GPG Chairman (3095_IGc dated 30/6/03) circulated a draft amendment of UR Z10.1 for Council's agreement and use in discussions with the industry associations.
The draft was generally agreed by GPG but individual Members have requested that the following matters (which were deemed to be outside the remit of GPG in this task) be brought to Council's attention for further consideration:

1 DNV and NK stated that they can not accept a requirement for annual surveys of ballast tanks when the coating condition is less than GOOD and propose that GOOD be changed to FAIR.
2 In connection with item 1 above, DNV also propose to amend the definitions of FAIR and POOR in order to raise the standard of FAIR.

Council Chairman (3095_ICb dated 14/8/03) concluded that Council has agreed that the draft amendments to UR Z10.1 attached to IGc reflect Councils' decision taken at C47 and that they be circulated to industry associations.
Perm Sec was therefore invited to submit the draft to OCIMF and INTERTANKO in view of discussion at the IACS/ industry meeting on 29 August.

2. Discussion with Industry (29/08/2003 – 11/10/2003)

As requested by Council, the whole matter was presented to Industry during the "general matters" meeting with IACS held on 29 August 2003; comments from Industry were requested. In the following an extract from the minutes of the meeting (see message 3100aIAb dated 5 September 2003):

___________________________ from Meeting minutes _________________________________

4. & 5. Annual surveys of ballast tanks and IACS guidelines on coating repairs

M. Dogliani introduced the matter (see Items 4&5 in Appendix).

A. LinoCosta gave a presentation to show where concerns and decisions stand: too many cases when coating was considered fair at SS but problems occurred just after one/two years.

N. Mikelis commented on draft amendments to Z10.1 (Rev.11) stating that the extent of annual survey is not clear; it should be limited to the affected zones, e.g. coating breakdowns, only.
M. Guyader clarified that, in this draft amendments, it is expected an overall survey of the whole tank and a close up survey of the affected zones.
N. Mikelis noted that, in the draft amendments to Z10.1 (Rev.11), the intermediate survey at 12.5 years would have the same scope as the previous special survey and that needed a justification. See 7 a).
M. Dogliani said that Z10.1 (Rev.11) was adopted in August 2003 and will be introduced into IACS Societies' Rules over the next year.

Conclusions:
4.1 Industry shared IACS concerns on coatings and, in general, agreed with the draft amendments to Z10.1 (Rev.11) suggesting also extending them to Z10.2 on bulk carriers

4.2 Industry agreed that a guideline for surveyor on coating would greatly improve uniform application of so-amended Z10.1 including issues such as how to consider load bearing elements when judging GOOD/FAIR/POOR status and how to consider bottom pitting in connection with GOOD conditions
4.3 Industry will more precisely comment, by the end of September, the draft Z10.1 so as for IACS to finalise the matter, as planned, for the Council's December meeting.

Item	Title	Industry recommandation	IACS/ M. Dogliani Introduction
4 & 5	Annual survey of ballast tanks IACS guidelines on coating repairs	NN	**1. IACS is considering the following:** - **amend UR Z10.1 (draft circulated to Industry) to the effect that in case at Special Survey or Intermediate Survey the coating in a ballast tank is found less than GOOD, either GOOD conditions are restored or the tank's coating is inspected at each annual survey;** - **develop IACS guideline to assist an uniform application of the so modified (if adopted) UR Z10.1; the guideline should address which repairs are necessary to restore GOOD conditions from FAIR and POOR respectively and which are the criteria for the restored (after repair) situation to be rated as GOOD.**

______________________________ End of extract from minutes ____________________________

INTERTANKO commented (see R. Leslie email to GPG dated 25 September 2003):

- expressing their concern for the draft Z10.1 and underlining

  a) targeting: concerns that, if not properly dealt with, Z10.1 would target all ships and not just those which need intervention; the view was expressed that guidelines would probably solve the matter;

  b) definition: indicating that the current definitions of GOOD, FAIR and POOR is not clear enough and that the matter would be even worst with GOOD and NON GOOD; again it was indicated that guidelines could solve the matter;

  c) expertise: expressing doubts on IACS' surveyors expertise and ability to judge coating conditions; in this respect they (hiddenly) suggest that IACS position is unclear when we say that we are not competent to judge the coating during construction but then we are competent to judge coating during operational life. Even if not explicitly stated, the impression is that also in this case guidelines would help.

Additionaly, INTERTANKO suggested a (quite detailed) set of assessment criteria.

The matter was then finally addressed at the TRIPARTITE Meeting (held in Soul on 29/30 September 2003). There Industry agreed that the way forward was the (joint) development of IACS guidelines (see minutes attached to message 3100_RIe dated 11 October 2003, an extract of which is reproduced below).

______________________________ Extract from the TRIPARTITE minutes ________________

Industry is concerned by the definition of GOOD/NOT GOOD in relation to coating repairs and acceptance criteria. Industry agreed that new guideline on this, which IACS is already producing, was the way forward.
_______________________________ End of the extract from the minutes ___________________

3. Further developments

a) from the above, it was concluded that, provided the guidelines are sound, Industry would accept the concept of Z10.1 (draft) Rev. 12, therefore an IACS team and a JWG were established in order to progress the matter of the guidelines (among other related matters).
b) the team of IACS experts on coating developed draft guidelines and provided recommendations to GPG on the way forward (attached to message 3095bNVc dated 20 November 2003).
c) the guidelines were discussed within the JWG with Industry (see draft minutes circulated within GPG with messages 3095cIGd and 3095cIGe both dated 13 March 2004)
d) further suggestions and comments (as requested at the meeting) were provided by Industry (not circulated to GPG)
e) Bulk Carrier Industry is recommending that similar guidelines are developed in due time also for bulk carriers
f) at DE47 and MSC78, IMO is asking Industry and IACS to develop (compulsory) performance standards for coating of newbuilding (double hull spaces of DSS Bulk Carriers), a matter which is, indirectly related to the above one.

1 June 2004
M. Dogliani

Subject: FW: 1060gNVs; WP/SRC - Task 102 - Harmonization of UR Z 7 and Z 7.1

25 May 2005

To: Mr. B. Anne, Chairman of IACS Council,
cc: Council Members, IACS Perm. Sec.

Ref.: My mail NVr dated 20 May 2005

DNV have further studied the amendments to UR Z10.1, Z10.3, and Z10.4, and as a result are presenting the following as a compromise solution:

General comment:
From the comments by other Members it is obvious that there is reluctance to accept annual surveys of ballast tanks with a common plane boundary to heated cargo tanks in the case where the coating is in good condition. This is particularly unreasonable as at the same time we enhance the Intermediate survey of Tankers between 10 and 15 years to also include examination of all ballast tanks, meaning that all ballast tanks will be close up surveyed with 2-3 years intervals from the ship is 10 years old, with the possibility for the surveyor to require thickness measurements and testing of the tanks to ensure the structural integrity of the tanks if necessary.
It is also proposed for the Intermediate survey between 5 and 10 years, to increas the scope from representative to all ballast tanks, a requirement DNV find to strict, and require that we here keep the original text.
If a ballast tank is found to have coating in GOOD condition at the renewal or intermediate survey, a deterioration of the tank beyond structural reliability is very unlikely even if the tank has a common plane boundary to a heated cargo tank.

DNV finds it particularly unreasonable to have this requirement to apply to double hull tankers for the following reasons:
- these ships have double hull and the risk of pollution is here much reduced,
- the double hull is constructed with small spaces giving improved structural reliability,
- almost all double hull tankers below VLLC have heated cargo tanks, and all ballast tanks have common plane boundaries to these tanks, meaning that this requirement will apply to a major part of the tanker fleet in the future,
- the ballast tanks of double hull tankers are so designed that a general examination of these tanks will be identical to a close up survey,
- survey of ballast tanks of double hull tankers will mean either gas freeing of all cargo tanks or at least dropping the inert gas pressure of all cargo tanks in addition to proper airing of all ballast tanks.

Since the single hull tankers will be faced out in the near future, and for clear political reasons, DNV will as a compromise proposal to keep paragraph 2.2.3.1 and 4.2.2.2 in Z 10.1 as amended by Council (ref. IAo) but amend it to not include 2.2.3.1.e, 4.2.2.2.e and last paragraph of 3.2.5.1 in Z10.3 and Z10.4. In addition we request that the original text of 4.2.2.1 is kept.
If BV, ABS and other Members can accept this DNV is willing to drop our reservation presented at C49.
DNV's proposal will then be as follows:

Z10.1:

2.2.3.1: This paragraph can be accepted as is for the reasons stated above.
3.2.5.1: This paragraph is accepted as amended.
4.2.2.2: This paragraph can be accepted as is for reasons stated above.

For other comments to Z10.1 see NVo and NVp.

Z10.3:

2.2.3.1.e to be deleted.
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept."For tanks used for water ballast ---"
4.2.2.2.e to be deleted

Z10.4

2.2.3.1e to be deleted
3.2.5.1 delete last paragraph
4.2.2.1 the original text to be kept, "For tanks used for water ballast --"
4.2.2.2.e to be deleted.

For details see attached document where the text for the requirements in Z10.3 and Z10.4 that DNV will accept is stated.

Best Regards

Arve Myklebust
on behalf of
Terje Staalstrom
DNV IACS Council Member
<<Doc1.doc>>

Annex 2 to TB (Harmonization Z10s)

WP/SRC Task 114 "Clarify the procedure of verification and signature of the thickness measurement report"

Item No.	Item	ABS	BV[1]	CCS	CRS	DNV	GL	IRS	KR	LR	NK	RINA	RS
1	**Verification onboard**	.											
1.1	Minimum extent of measuring points for direct verification by attending surveyor specified	No	No	No	No	No	No	No	Yes	No	No	Yes	No
1.2	Preliminary TM record to be signed upon completion of the measurements onboard	Yes	Yes [7]	Yes	No (copy taken)	No[3]	No[6]	Yes	Yes	Yes	Yes	No[8]	No
2	**Final TM report**												
2.1	Signature of all pages in TM record required	No	No	No	Yes	No	Yes	Yes	No	No	No[5]	Yes	Yes
2.2	Signature of 'cover' ('general particulars') page only	Yes	Yes	Yes	No	Yes	No	No	No[4]	Yes	Yes	Yes	No
2.3	Measuring points verified by attending surveyor required identified in TM record and signature of the corresponding pages required	No	No	Yes Without signature	Yes	No	No	No	Yes	No	No	No	No

2004-04-20

[1] Instructions not clear regarding signature of the thickness measurement record

[2] Signature on front and last page, stamp on all other pages, or signature on each page (IACS TM forms)

[3] Upon completion of measurements onboard a draft report in electronic format (DNV TM template, including operator's notes as relevant) to be given to attending surveyor

[4] Signature of cover page, pages of meeting record and pages of attended measuring points

[5] Each page to be signed in case of 'loose-leaf' type record

[6] Preliminary TM record has to be passed to the Surveyor, signed by the Operator

[7] The only measures which the Surveyors can certify exact are those for which that they have seen the results on the screen of the apparatus. That means in fact few points in comparison with the numbers of recorded measures.

[8] The Surveyor reviews the TM record for completeness and assessment of TM readings, but no signature required.

Annex 3: **Technical Background**
(May 2005)

UR Z7s and Z10s (Corrosion Prevention System)

1. Objective:

To clarify whether the survey of anodes is a class matter, and if so, whether acceptance criteria for anode should be developed.

2. Method: GPG by correspondence (5037_)

3. Discussion

3.1 BV initiated GPG discussion as follows:

Paris La Défense, 8 Mars 05

1 - We have noticed that, in the draft UR Z's (7.1, 10.1 to 10.5) issued further to the WP/SRC Task 102, the original sentence "......the examination may be limited to a verification that the hard protective coating remains efficient......" has been replaced by ....that the corrosion prevention system remains efficient....". in a number of paragraphs (such as , for instance, Z 7.1, 4.2.3.1 a) ; Z 10.2 4.2.3.3 ;), in line with IMO Res.A744(18).

2 - However, a corrosion prevention system is defined, in the same UR Z's and in IMO Res.A744(18) , as being either a full hard protective coating or a full hard protective coating supplemented by anodes.

3 - The above would mean that the survey of the anodes is a classification matter.

4 - However, whereas coating conditions are defined as good or fair or poor, there are no criteria in the IACS URs and IMO Res. A744(18) for the anodes condition.

5 - Assessing the anodes condition to confirm that they "remain efficient" looks to BV to be a quite difficult task for the ships in service Surveyor.

6 - Member's view and interpretations on the following would consequently be appreciated:
- do Members consider that the above requirements in IACS URs imply that survey of anodes is part of the classification ?
- do Members consider that the above requirements in IMO Res. A 744 (18) imply that survey of anodes is mandatory?
- if yes, what is the acceptance criteria to conclude that the anodes" remain efficient" ?

3.2 The majority of GPG Members replied that they did not include requirements for anodes in their class rules.

LR / ABS / DNV / KR / NK / RINA / RS were of the view that the condition of any anodes fitted should be recorded for information purposes as the survey of anodes is neither a classification matter nor a mandatory requirement in IMO A.744(18) and has no impact on future surveys (5037_LRa**). [**Note; LR further clarified that “Whilst I agree that the performance of anodes is not normally a class matter LR does require that as part of Special Survey on oil tankers : "The attachment to the structure and condition of anodes in tanks are to be examined ." Therefore we cannot say that 'the survey of anodes is not a classification matter'**. 5037_LRb]**

However, GL said that “for GL, anodes are a matter of class and as such are subject to plan approval as well as surveys. In case of missing or worn-out anodes we issue a condition of class”(5037_GLa&b).

CCS advised that its rules have a general requirement relating to anode survey, which is only conducted, through sampling, during construction, docking survey or where there is a definite requirement for the survey of ballast tanks.

NK proposed that the following footnote be added to Z7s and Z10s:
“The survey of anodes is not a classification matter.” No majority support was achieved.

4. Conclusion

RINA suggested to simply amend the definition of "Corrosion Prevention System" in paragraph 1.2.9 of UR Z7 (and, of course, the paragraphs in all the other UR Zs containing the definition of "Corrosion Prevention System") in order to eliminate any reference to anodes. This proposal would leave room for Societies willing to include additional class requirements for anodes to do so in their Rules.

GPG agreed.

RINA proposed amendments to paragraph 1.2.9 of UR Z7 and corresponding paragraphs in all other UR Zs (5037_RIb, 6 April 2005)

1.2.9 Corrosion Prevention System

A corrosion prevention system is normally considered ~~either:~~ a full hard protective coating.
~~.1 a full hard protective coating, or~~
~~.2 a full hard protective coating supplemented by anodes.~~
Hard protective coating is usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer’s specifications.
Where soft coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

Annex: Council Chair’s conclusive message.

6 May 2005
Permsec

Annex. (5037_ICb, 15 May 2005)

To : All IACS Council Members
c.c : Mr. R. Leslie, IACS Permanent Secretariat

Ref. Mr G-Y. Han's message IAa dated 6 May 05
Message ICa dated 6 May 05
Admiral R.E. Kramek's message ABb dated 13 May 05

Paris La Défense, 15 May 05

1 - All Members have agreed with the texts attached to Mr Han's message.

2 - Further to ABS comments the reference to anodes is to be deleted in Annex I and in tables IX (IV) and IX(II).

3 - further to ABS questions regarding what IACS plan to do regarding IMO and A.744(18) further to IACS deletion of reference to anodes from the UR Z7's and UR Z10's it is to noted that:

The Item 1.2.9 in UR Z1O.1 and relative items in these URs states
1.2.9 10 Corrosion Prevention System: A corrosion prevention system is normally considered either:
.1 a full hard protective coating, or
.2 a full hard protective coating supplemented by anodes.
Hard Pprotective Ccoating is to usually to be epoxy coating or equivalent. Other coating systems may be considered acceptable as alternatives provided that they are applied and maintained in compliance with the manufacturer's specification.
Where Soft Coatings have been applied, safe access is to be provided for the surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

- therefore the anodes are not considered as the main means of protection against the corrosion It is only a supplement;

- there is no provision in UR Z7's and Z10's to evaluate the level efficiency of the anodes;

- there is no specific requirements in case of lack of efficiency of the anodes.

The experience has shown that ballast tanks only protected by anodes are subject to corrosion when the anodes are becoming less efficient.

The anodes are active only when immersed by sea water. Therefore the upper part of the ballast tanks are not protected when the ballast is full of water and the ballast is not protected when it is empty..

The ships operators are reluctant to replace the anodes especially in upper part which request fitting of scaffolding fo welding the anode supports to the structure.

The above arguments justify the reasons why IACS consider that the anodes are not class item.

4 - These arguments can be used by IACS Members attending the WG bulk carriers at MSC 80 to try to obtain deletion of the reference to anodes in A. 744(18).

Best regards,

Bernard Anne
IACS Council Chairman.

Technical Background

UR Z10.1(Rev.13, Jan 2006)
UR Z10.2(Rev.18, Jan 2006)-separate TB
UR Z10.3(Rev.8, Jan 2006)
UR Z10.4(Rev.3, Jan 2006)
UR Z10.5(Rev.2, Jan 2006)

Part 1. Z10s – para. 1.4 and 7.1.3

Part 2. Z10s – para. 5.5.4 and 5.5.6

Survey Panel Task 22 – Amend applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

Technical Background

Z7(Rev.12)
Z7.1(Rev.3)
Z10.1(Rev.13, para.1.4 & 7.1.3)
Z10.2(Rev.18, para. 1.4 & 7.1.3)
Z10.3(Rev.8, para. 1.4 & 7.1.3)
Z10.4(Rev.3, para. 1.4 & 7.1.3)
Z10.5(Rev.2, para. 1.4 & 7.1.3)

1. **Objective**

To amend the applicable URZ7s and Z10s to align Close-Up Survey and Thickness measurements to be carried out at the same time and location allowing for a more structured control of the thickness measurement process.

2. **Background**

IACS QC findings, through audits of numerous Societies, which indicated concerns over Surveyor attendance and control of thickness measurement processes.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

To align Close-up survey requirements and thickness measurements in the applicable URZ7s and URZ10s, in accordance with PR19, all Panel members agreed through correspondence and a final vote at the fall Survey Panel meeting, that URZ7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 should include in the applicable sections of the noted URs as proposed by the Survey Panel the wording “ In any kind of survey, i.e. special, intermediate, annual, or other surveys having the scope of the foregoing ones, thickness measurements of structures in areas where close-up surveys are required, shall be carried out simultaneously with close-ups surveys.”

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Technical Background

UI SC 191 (Rev.2, Oct 2005)

&

UR Z10.1 (Rev.13, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.2 (Rev.18, para. 5.5.4 and 5.5.6, Jan 2006)
UR Z10.3 (Rev.8, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.4 (Rev.3, para.5.5.4 and 5.5.6, Jan 2006)
UR Z10.5 (Rev.2, para.5.5.4 and 5.5.6, Jan 2006)

1. Objective

- to confirm whether the guidelines for approval/acceptance of alternative means of access (now REC91, ex Annex to UI SC191) is mandatory or non-mandatory.
- to consider other safety related proposals.

2. Background

The DNV proposal to submit the UI SC191(Rev.1, May 2005, Annex 1) to IMO DE49 triggered a number of discussion points that led to amendments to the following resolutions:

UI SC191(Rev.2)
New REC 91
REC 39(Rev.2)
UR Z10s

Points of Discussion

3. Is the Annex to UI SC191(Rev.1, May '05, guidelines for approval / acceptance of alternative means of access) mandatory or non-mandatory ?

   Answer: Non-mandatory. Hence, re-categorized as new REC 91.

4. Limitation of use of rafts in bulk carrier holds

   DNV proposed that conditions for rafting should be limited to areas, such as anchorage or harbour, where swell conditions are limited to 0.5m. After discussion, GPG approved the ABS' alternative proposal to use the swell condition as a basis to determine the appropriateness of rafting, instead of geographic areas(harbours or anchorage). 5.5.4 of Z10.2 refers.

RINa proposed that para 5.5.4 should be included in all the Z10s. NK's objection is recorded as follows (3037hNKq, 29/08/2005):

> 1. With regard to RIm of 26 August 2005, NK considers that the proposed amendment to 5.5.4 should be limited to UR Z10.2.
>
> 2. Rafting survey for tankers are actually carried out on the open sea from a discharge port to a loading port and in such situation the rise of water within the tanks would always exceed 0.25m. It is different situation from rafting survey for hold frames of bulk carriers normally conducted in a harbour or at an anchorage.
>
> 3. If the same requirement applies to tankers, any rafting survey for cargo oil tanks and ballast tanks of tankers would be prohibited. This is not practicable under present survey procedure for tankers.
>
> 4. Therefore, NK can not support Laura's proposal that the proposed amendment to 5.5.4 of UR Z10.2 is introduced into the other URs and new Recommendation.

For compatibility with the IMO's mandatory requirements*, GPG decided to add the same amendment to all the UR Z10s.

*

- Appendix 4 to MEPC.99(48) ' Mandatory requirements for the Safe Conduct of CAS Surveys'
- MSC.197(80) – amendments to A.744918), Annex A for DSS and SSS bulk carriers and Annex B for single and double hull oil tankers.

As a consequence, 5.5.1 of REC 91(ex Annex to UI SC191) was also amended:

-to remove the reference to dynamic /sloshing (as the 0.25m rise was considered negligible);

-to refer to the rafting conditions contained for cargo holds in Z10.2 and Z10.5 and for oil cargo tanks in Z10.1 and Z10.4.

5. Means of access from longitudinal permanent means of access within each bay to rafts

GPG reviewed the proposal that the following text be added to Z10s:

A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay.

(Technical Background: for the safety of surveyors)

There may be ships which are arranged in accordance with para b, page 8 of the Annex to the current SC 191 (i.e., no means of access from the LPMA in each bay to a raft is required) and therefore could not be rafted if the sentence proposed by RINA("A means of access to the longitudinal permanent platform from rafts or boats is to be fitted in each bay") is included in the Z10's.
GPG therefore agreed not to include this sentence in Z10s.

For the same reason, the same sentence was not added to Rec.39.

Finally, GPG added the following sentence to UI SC191(interpretation for II-1/3-6):

> *A permanent means of access from the longitudinal platform to the water level indicated above is to be fitted in each bay (e.g permanent rungs on one of the deck webs inboard of the longitudinal permanent platform).*

6. Implementation

It was agreed that the revised UI SC191 be implemented to ships contracted for construction 6 months after adoption by Council.

UI SC191 was also edited in line with IMO MSC/Circular. 1176, leaving its mandatory language (is/are to, shall) unchanged.

(Note: UI SC191(Rev.2) makes references to the following new Recommendations:
- REC 90: Ship Structure Access Manual
- REC 91: Guidelines for approval/acceptance of Alternative Means of Access)

23 September 2005
Permanent Secretariat
Updated on 13 Oct 2005.

Survey Panel Task 11 – Unified Periodic Survey Requirements related to SOLAS Reg. XII/12 & Reg. XII/13.

Technical Background
Amendments to UR Z10.2(Rev.19, Jan 2006) and UR Z10.5 (Rev.3, Jan 2006)

1. Objective

To amend UR 10.2 Section 2.6 and 3.4 and UR Z10.5 Section 2.6 and 3.3 to include survey requirements related to SOLAS reg. XII/12 and XII/13.

2. Background

This task was originally discussed during the WP/SRC annual meeting which took place at DNV Headquarters on the 26th to 28th October 2004; it was subsequently recorded under paragraph 9 "any other business" of the minutes of this meeting.
While the SOLAS Reg.XII/12 (hold, ballast and dry spaces water level detectors) and XII/13 (availability of pumping systems) retroactive requirements for existing bulk carriers have entered into force on 1st July 2004, as required by IMO Res.MSC.134(76), the IACS UR S 24 has been deleted on 1st January 2004.In addition, SOLAS does not include any periodical survey requirements for such detection systems and pumping systems.

3. Methodology of Work

Survey Panel members through correspondence.

4. Discussion

Survey Panel member from BV raised this issue at the February 2005 Survey Panel meeting and volunteered to propose amendments to the applicable URs for Panel members to review and comment on through correspondence. At the Fall meeting of the Survey Panel, it was agreed upon by all Panel members that the proposed amendments for UR Z10.2 and Z10.5 as applicable, which were proposed by BV were acceptable.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

Submitted by Survey Panel Chairman
4 Nov 2005
approved on 31 Jan 2006 (5031fICa)

Survey Panel Task 43 – Amend the applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

Technical Background

(UR Z10.2, Rev.22, June 2006)
(UR Z10.4, Rev.4, June 2006)
(UR Z10.5, Rev.4, June 2006)

1. **Objective**

Amend applicable sections of the URs to address the requirements for substantial corrosion in the Common structural rules.

2. **Background**

Due to the different application of substantial corrosion in the CSR from the current Unified Requirements.

3. **Methodology of Work**

Panel members discussed the proposed revisions through correspondence up to the Spring Panel meeting where final amendments were agreed upon for submittal to the IACS Hull Panel for review.

4. **Discussion**

After much discussion between all Panel members at the March 2006 Survey Panel members, a unanimous decision was reached as to the wording of CSR Substantial corrosion in UR Z10.2, 10.4, and 10.5 in section 1.2.9 and was then submitted to the Hull Panel for review and approval. The hull panel concluded that the Survey Panel definition for CSR substantial corrosion was not entirely accurate and recommended further amendments to clarify the actual requirements. The new definition was then circulated to the Survey Panel for a final review and was unanimously agreed upon.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules/procedures. Assuming that GPG and Council approve the amendments, the Survey Panel would propose **July 2007 as** an implementation date.

Submitted by Survey Panel Chairman

Technical Background

UR Z10.1 (Rev.14), UR Z10.2 (Rev.23), UR Z10.4 (Rev.5) & UR Z10.5 (Rev.5)

Survey Panel Task 3 – Maintenance of Alignment/ Compatibility of IACS URs and IMO survey requirements

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements regarding resolution MSC 197(80) – amendments to A744(18)

2. **Background**

IMO survey requirements to ESP vessels as amended in A744(18) as noted in MSC 197(80), with an implementation date of 1 January 2007.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel members, at the fall 2006 Survey Panel meeting, finalized the amendments to the applicable URs due to changes adopted at MSC(80).
Additionally, Members noted that URZ10.4 paragraphs 2.2.3.1 and 4.2.2.2 does not require examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80). The survey panel agreed that if this is the position that IACS would like to take regarding double hull tankers, then it should be brought to the attention of IMO at the next IMO meeting, DE50 in March 2007.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve the amendments, the Survey Panel would propose January 2008 as an implementation date, although the IMO implementation date is January 2007.

Submitted by Survey Panel Chairman
9 January 2007

GPG discussion

All members agreed to omit the requirement of examination of ballast tanks adjacent to heated fuel tanks, as required by MSC197(80), from URZ10.4 for double hull tankers and

that it should be brought to the attention of IMO at DE50. In addition ABS proposed that paragraphs relating to similar requirements in URZ10.1 should also be deleted for consistency and this was agreed by members.

Members also made a number of minor/editorial corrections to the text prior to their approval of the revised documents.

Added by Permanent Secretariat
23 April 2007

Technical Background Document

UR Z10.5 (Rev.6 April 2007) & UR Z10.2 (Rev.24 April 2007)

(Survey Panel Task 10 – Develop survey requirements for void spaces of ore carriers)

1. Objective:
Develop survey requirements for void spaces of ore carriers

2. Background
DNV requested at WP/SRC Annual meeting October 2004 to develop survey requirements void spaces of ore carriers. See the attached document « Ore Carriers, Hull Survey Requirements » for easy reference.
NK submitted a « A case study on a certain Ore Carrier » dated 22 October 2004 for this purpose.

3. Discussion
The task has been carried out by a Project Team chaired by DNV Survey Panel member and with Survey Panel members from BV, LR, NK and RINA.

The Project Team drafted new amendments to Unified Requirement UR Z 10.5 « Hull Surveys of Double Skin Bulk Carriers » using the same principles contained in the survey requirements of UR Z10.1 for ballast spaces of single hull oil tankers with appropriate adjustments recognizing that void spaces do not carry ballast water.

In that respect, a new TABLE I/Sheet 2 was developed to cover the minimum requirements for close-up surveys at special hull surveys of ore carriers. The existing TABLE I, renamed TABLE I/Sheet 1, was made applicable to double skin bulk carriers excluding ore carriers.

Accordingly, TABLE III/Sheet 3 (REQUIREMENTS FOR EXTENT OF THICKNESS MEASUREMENTS AT THOSE AREAS OF SUBSTANTIAL CORROSION OF DOUBLE SKIN BULK CARRIERS WITHIN THE CARGO LENGTH AREA) was renamed STRUCTURE IN DOUBLE SIDE SPACES OF DOUBLE SKIN BULK CARRIERS INCLUDING WING VOID SPACES OF ORE CARRIERS.

In addition, Sheets 15 and 16 of URZ10.2 Annex II are to be removed.

The draft amendments to UR Z10.5 were presented to the Survey Panel members on the 13th-15th September 2006 meeting at ABS Headquarters in Houston and were finally agreed by all members on the 22nd September 2006.

4. Implementation
The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class Rules/procedures. Assuming that GPG and Council approve the amendments by the end of 2006, the Survey Panel would propose as an implementation date for surveys commenced on or after the **1 July 2008**

Submitted by Survey Panel Chairman
22nd March 2007

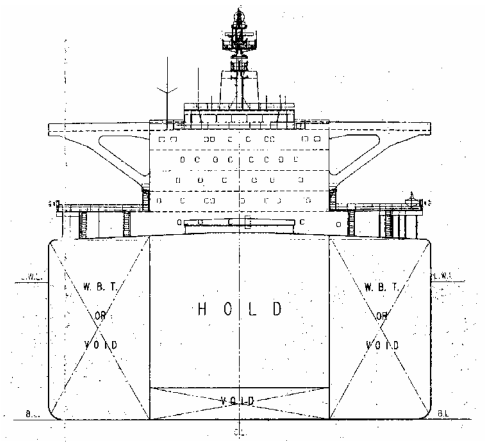
<u>Permsec note (May 2007):</u>
Revisions adopted by GPG 12 April 2007 (5031hIGg).

Attachment:

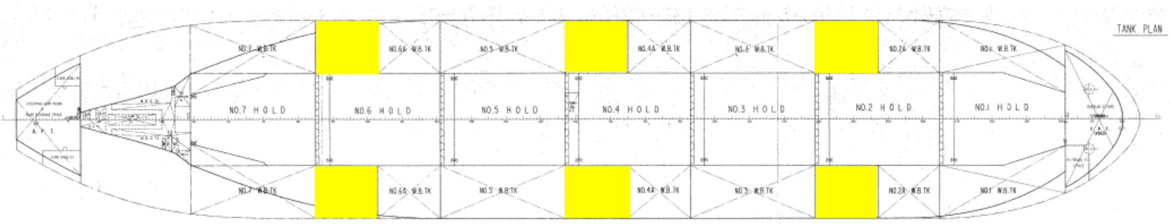
Ore Carriers, Hull Survey Requirements

"Ore carrier" means a single deck ship having two longitudinal bulkheads and a double bottom throughout the cargo region and intended for the carriage of ore cargoes in the centre holds only. Side tanks are generally arranged for the carriage of water ballast.

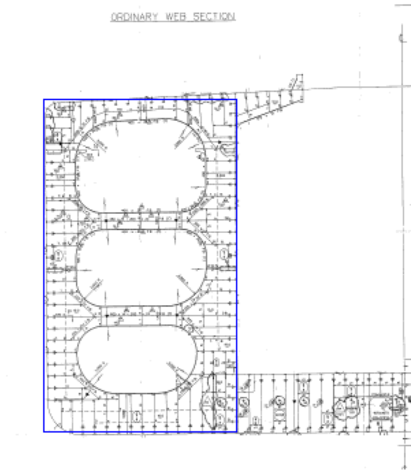
In accordance with UR Z10.5, for close-up surveys of side ballast tanks of ore carriers, the survey requirements of side ballast tanks for oil tankers as given in UR Z10.1 apply.



However, the amount of ballast water required to meet draught requirements for navigation / harbour operations, are generally less than the total capacity of the side tanks.
Hence ore carriers are often designed with several side tanks as void spaces.



The internal structures are generally as for side ballast tanks with transverse web frame rings. The protective coating, if any, may be less durable than coating applied for ballast tanks and the void spaces are exposed to corrosion.



Ore carriers are generally large sized vessels and the overall survey of side void spaces may not be sufficient in order to carry out a meaningful survey for detection of corrosion and other structural defects.

It is proposed to consider minimum requirements for close-up surveys for side void spaces. Requirements given in UR Z10.1 applicable to side cargo tanks may be used as basis.

DNV 2004-10-19

Technical Background

UR Z10.5, Rev. 7 (July 2007) - Amendment to Table II

Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions

1. **Objective**

Maintenance of alignment/compatibility of IACS URs and IMO survey requirements.

2. **Background**

This proposed change was raised by the DNV Survey Panel member due to inconsistencies found in the UR Z10s.

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

The DNV Survey Panel members raised the issue of alignment of TM requirements for vessels falling under the Z10s, where at Renewal Survey#2, TM was required for selected wind and water strakes outside the cargo area, except for vessels under UR Z10.5.
All Survey Panel members agreed to the inconsistency and further agreed to the proposed changes.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose July 2008 as an implementation date.

Submitted by Survey Panel Chairman,
25 June 2007

Permanent Secretariat note (July 2007):
Adopted by GPG with an implementation date of 1 July 2008 on 14 July 2007 (ref. 7596_IGb).

Technical Background

URs Z7(Rev.15), Z7.1(Rev.5), Z7.2(Rev.1), Z10.1(Rev.15), Z10.2(Rev.26), Z10.3(Rev. 9), Z10.4(Rev.6), Z10.5(Rev.8) – November 2007

Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions

1. Objective

To review IACS Resolutions annually and discuss or propose amendments as deemed necessary.

2. Background

This proposed amendment to all URZ7s and URZ 10s was raised by the Panel member from DNV due to Owners crediting tanks concurrently under intermediate and special survey.

3. Methodology of Work

Survey Panel members through correspondence.

4. Discussion

The Panel member from DNV raised the issue of Owners having the ability of crediting spaces and thickness measurements only once in a 54 month interval, due to the availability of concurrent crediting of spaces and thickness measurements due to the flexible time window that is currently allowed between the intermediate survey and the special survey.
After a presentation and discussion lead by the DNV Panel member, all Survey Panel members agreed to the argument given by DNV, and further agreed to make the necessary changes in all URZ7s and URZ10s where Owners are not allowed to concurrently credit surveys and thickness measurements of spaces.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG approve to the amendments, the Survey Panel would propose January 2009 as an implementation date.

Submitted by Survey Panel Chairman
22 October 2007

Permanent Secretariat note (December 2007):

During GPG discussion DNV proposed that *“since this matter will be discussed between Owner and Class mainly in connection with the forthcoming Special Survey, DNV would prefer to locate this text, not only as part of Intermediate Survey, but also as a new text for the Special Survey.”* This was supported by BV, ABS, RINA and KR.

The revised documents were approved, with DNV’s proposal and an implementation date of 1 January 2009, on 15 November 2007 (ref. 7690_IGb).

Technical Background

URs Z7(Rev.16), Z7.1(Rev.6), Z7.2(Rev.2), Z10.1(Rev.16), Z10.2(Rev.27), Z10.3(Rev.11), Z10.4(Rev.7) and Z10.5(Rev.9) - March 2009

Survey Panel Task 62:

A) Harmonization of UR Z10.1, Z10.2, Z10.4 and Z10.5 with UR Z10.3 with respect to items 5.5.4.4 and 5.6.2.

B) Harmonization of UR Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 with UR Z7.2 with respect to the definition of the corrosion prevention system and with respect to the footnote 1 related to semi-hard coatings.

C) Harmonization of the definition of Ballast Tank in UR Z7(Rev.14)

1. Objective

A) Amend the texts of items 5.5.4.4 and 5.6.2 in Unified Requirements Z10.1, Z10.2, Z10.4 and Z10.5 in order to align them with those in UR Z10.3, in which they were changed while performing Task 55, whereas in the other UR Z10s they were kept unchanged on the grounds that this change was out of the scope of Task 55.

B) Amend the definition of "Corrosion Prevention System" and include a Footnote 1 related to semi-hard coatings in Unified Requirements Z7, Z7.1, Z10.1, Z10.2, Z10.3, Z10.4 and Z10.5 in order to align them with those adopted in UR Z7.2, when this new UR was issued.

C) Amend UR Z7 (Rev. 14) in all items where the term "Ballast Tank" is used in order to get them harmonized with the definition itself.

2. Background

The task, as regards item A), was triggered by a Member Society, while performing Task 55, on the grounds that this part was out of the scope of the task and then should have been dealt with in a separate task.
The task, as regards item B), was triggered as a consequence of the "New Business action item 2" of the Minutes of the September 2008 Survey Panel meting, for sake of harmonization of the various URZs.
The task, as regards item C), was triggered as a consequence of the "Task 54-Examination of Double Bottom Ballast Tanks at annual surveys" of the Minutes of March 2008 Survey Panel meeting, for sake of harmonization of the definition of Ballast Tank in UR Z7(Rev.14).

3. Discussion

The task was carried out by correspondence. All the amended texts for the affected URs were prepared by the Survey Panel Member who had chaired the PT on Task 55, in accordance with the Form A approved by GPG. In addition to the objectives outlined in the Form A, an amendment was added to item 1.3.1 of UR Z10.2 and UR Z10.5 in which the reference 3.2.3.6 in the last item of the list was replaced by 3.2.3.10 as can be correctly verified in the text.
The amended URs were circulated to all Survey Panel Members for review, comments and agreement. The texts of the URs were unanimously agreed by all Members.

4. Implementation

The Survey Panel is of the view that the Member Societies need at least 12 months from the adoption date to implement these amendments into their class rules/procedures. Therefore, in the first version of all amended URs the following implementation sentence should be proposed:

Changes introduced in Rev .xx are to be uniformly applied by Member Societies and Associates for surveys commenced on or after [not less than 12 months after the adoption by GPG/Council].

Since it is common practice and convenience to have implementation dates either on 1st January or on 1st July of the year, the Survey Panel proposes the 1st July 2010 as implementation date, if GPG/Council approve the URs not later than 30 June 2009.

Submitted by Survey Panel Chairman
28 February 2009

Permanent Secretariat notes (April 2009):

1. The amended URs were approved by GPG on 18 March 2009 (ref. 7718bIGd).
2. During the typesetting process it was noted that para 5.1.5 of UR 7.2 was inconsistent with the amended URs and so following consultation with the Survey Panel this was also amended at this time.
3. Regarding the implementation date, GPG agreed to use 1st July 2010 provided that it was consistently used for the amended URs.

Technical Background for UR Z10.5 Rev.10 (Mar 2011)

1. Scope and objectives

1) To amend UR Z10.4 to harmonize the definition of transverse section.

2) Update of references in the Executive Hull Summary Table IX.

3) Review IACS URZ10.5 to determine if there are issues which need to be addressed to ensure that the IACS survey regime and the CSRs are compatible.

2. Engineering background for technical basis and rationale

1) Based on that fact that bulk carriers and oil tankers have a transverse framing system applied for example on ship's sides etc. and that UR Z7 is applied to all types of ships and includes an extended definition of transverse section it is necessary to unify this definition in UR Z10s.

2) Update of references in the Executive Hull Summary Table VII such that the introduction of extended annual surveys is noted in the 'Memoranda' section rather than under 'Conditions of Class'.

3) Some requirements in CSRs for Bulk Carriers were relevant to ships in operation and it was decided to move them from CSRs to UR 10.5 in more consistent way.

3. Source / derivation of the proposed IACS Resolution

CSR, IACS UR Z7.
Proposed amendments to UR Z10.5 are based on internal discussion of IACS which is always striving to produce consistent and compatible rule requirements.

4. Summary of Changes intended for the revised Resolution:

1) The following additional text is added to the definition of transverse section in para 1.2.6:

   "For transversely framed vessels, a transverse section includes adjacent frames and their end connections in way of transverse sections."

2) In the Executive Hull Summary Table VII (iv) the reference to part G) is updated to part H) as per Table VII (ii).

3) The main amendment has consisted in removing the requirements found in the CSRs related to surveys after construction and locating them in the applicable sections of UR Z10.5. The rationale of that is to have only one place where survey requirements are given and avoid any duplication of requirements in different documents, which would give rise to problems of maintenance and alignment.

   Another important amendment has been the requirement for annual examination of the identified substantial corrosion areas for bulk carriers. One Member Society was of the opinion that there should be no difference between the CSRs and non-CSRs bulk carriers. The other Member Societies were of the opinion to consider an alternative examination, which was the original requirement in CSRs, and thus the following text was adopted in UR Z10.5:

"For vessel built under IACS Common Structural Rules, the identified substantial corrosion areas may be:
a) protected by coating applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in good condition, or alternatively
b) required to be gauged at annual intervals."

Other important amendments have been made moving the following items from the CSRs to Z10.5 as applicable:
a) the paragraphs regarding the different corrosion patterns, such as pitting corrosion, edge corrosion and grooving corrosion, and their different acceptance criteria,
b) the items regarding the number and locations of thickness measurements, together with the associated table and referenced figures.

Another notable change has been introduced in the "ANNEX II - Recommended Procedures for Thickness Measurements" of UR Z10.5, which, however, are only recommendatory and not mandatory, where thickness measurements forms specific to CSRs double skin bulk carriers have been produced in addition to the existing ones, which only apply to non-CSRs ships.

Finally, for CSRs bulk carriers the requirement has been introduced which stipulates that "the ship's longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the special surveys carried out after the ship reached 15 years of age (or during the special survey no. 3, if this is carried out before the ship reaches 15 years) in accordance with the criteria for longitudinal strength of the ship's hull girder for CSRs bulk carriers specified in Ch 13 of CSRs".

5. Points of discussions or possible discussions

See item 4 above.

6. Attachments if any

None.

Technical Background for UR Z10.5 Rev.11, July 2011

1. Scope and objectives

Review the requirement for repairs within IACS UR 7 and UR 10 series, in particular the requirement for Prompt and Thorough Repair, with a view to developing wording that would permit a temporary repair and the imposition of a Recommendation/ Condition of Class under specific and controlled circumstances, and in accordance with PR35.

2. Engineering background for technical basis and rationale

There are instances, for example a localised, isolated and very minor hole in a cross-deck strip, at which a suitable temporary repair, for example by welding or doubling, and the imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date, are considered very adequate methodology for dealing with the defect.

Current IACS Requirements in the UR Z7 and Z10 series, for Prompt and Thorough repair, would not permit this to be an option, the defect would have to be permanently Promptly and Thoroughly repaired, which might require removing cargo, moving to a repair berth and staging inner spaces.

Under the Requirements of IACS Procedural Requirement PR 35 the methodology of Temporary Repair and imposition of a suitable short term Recommendation/ Condition of Class for permanent repair at a later date is fully permissible.

3. Source / derivation of the proposed IACS Resolution

Based upon discussion within the IACS Survey Panel.

4. Summary of Changes intended for the revised Resolution:

Following the definition of Prompt and Thorough Repair in the Unified Requirement, a new paragraph is proposed to be added:-

"1.3.3 Where the damage found on structure mentioned in Para. 1.3.1 is isolated and of a localised nature which does not affect the ship's structural integrity, consideration may be given by the surveyor to allow an appropriate temporary repair to restore watertight or weather tight integrity and impose a Recommendation/Condition of Class in accordance with IACS PR 35, with a specific time limit."

Also, Table I was split to into 2 tables for enhanced clarity, Table I.1 for Single Skin and Table I.2 for Double skin ships and miscellaneous editorial errors in the Table I.1 and I.2 are corrected.

5. Points of discussions or possible discussions

a) The points of discussion are as indicated in Sections 2 and 4 above.

b) Discussion took place on whether to prepare this amendment as a Unified Interpretation of IMO Resolution A.744(18)/UR Z7 and Z10 series, finally it was agreed to make direct amendment to the relevant URs.
c) It is proposed that this amendment be submitted directly to the IMO DE/MSC Committees for consideration of amending directly IMO Res. A744(18)

Technical Background for UR Z10.5 Rev.12 May 2012

1. Scope and objectives

To clarify the SSH No. 2 requirement of Table I regarding close-up surveys.

2. Engineering background for technical basis and rationale

N/A

3. Source / derivation of the proposed IACS Resolution

N/A

4. Summary of Changes intended for the revised Resolution:

The requirement for close-up surveys at SSH No.2 as contained in Table I was clarified to indicate that close-up survey of the "forward and aft transverse bulkheads including stiffening system in a transverse section including topside, hopper side and double side ballast tanks" only applied to the tanks on one side of the ship. This clarification is consistent with the requirements of IACS Z10.2 for single skin bulk carriers.

5. Points of discussions or possible discussions

None

6. Attachments if any

Technical Background for UR Z10.5 Rev.14, Jan 2014

1. Scope and objectives

a) To consider appropriate text in IACS document regarding class period for lengthy conversions.
b) To align the requirements in PR37 and UR Z10s regarding safe entry to confined spaces.

2. Engineering background for technical basis and rationale

a) As per the IMO Res. A1053 (27), lengthy conversions (not necessarily of major character) or other major repair work can be assigned for a 5 year period from the date of completion of conversion/repairs/surveys.
b) Safety requirements in IACS PR37 can be applied to carry out survey in safe way for all kind of ships. When there are no indications about the safety of surveyor in UR Z10s then the requirements in PR37 shall be applied.

3. Source/derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

a) Following additional text was included to section 2.1.3 to clarify the class period for lengthy conversions

"In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date."

b) Existing Section 5.2.6 and 5.2.7 were deleted from UR Z10s since provisions of these sections were covered by PR37. Reference of PR37 was included in Section 5.2.1.1.

5. Points of discussions or possible discussions

i) Additional text to Para.2.1.3 was discussed in order to clarify class period.
ii) Panel considered that safety of surveyors should be dealt by PR37.

6. Attachments if any

None

Technical Background Document
UR Z 10.6 – New (June 2002), WP/SRC Task 82

Objective and Scope:

- To develop enhanced survey requirements for Special Survey No.3 and subsequent surveys as a UR for general dry cargo ships carrying solid cargoes and having SOLAS Safety Construction Certificate other than:

  .1 vessels subject to UR Z10.2;
  .2 dedicated container carriers;
  .3 ro-ro cargo ships;
  .4 pure car carriers;
  .5 refrigerated cargo ships;
  .6 dedicated wood chip carriers;
  .7 dedicated cement carriers.

Source of Proposed Requirements:

- WP/SRC developed UR Z10.6 through correspondence and two meetings during 2001. The first draft was prepared by LR using UR Z7 as the base document, but also taking into account consideration some of the requirements included in UR Z10.2

- The draft also took into account data held on dry cargo ships within the LR casualty database.

Points of Discussion:

1. WP/SRC has decided not to limit the development of enhanced survey requirements for these ship types to Special Survey No.3 and subsequent surveys, as it was considered technically sound to have a similar format of the survey requirements for these exposed ship types as for the other UR Zs.

2. WP/SRC discussed the need for a Survey Programme/Survey Planning Document and concluded not to include such a requirement.

3. WP/SRC further decided that a survey in dry dock is to be part of the Special Survey.

4. The proposed draft UR Z10.6 was unanimously agreed by WP/SRC.

5. TM Requirements for Special Survey No.3 & No.4 in Table II:

   - Item 4 of SS 3: “Within the cargo length, each deck plate outside line of cargo hatch openings”
   - Item 2(b) of SS 4: “Within the cargo length, each deck plate outside line of cargo hatch openings”

   Council agreed to change Table II as shown above (1060dICb, 17 June 2002).

Attached: GPG Report to Council on Safety of General Cargo Ships (extracts)

Date of submission: 20 May 2002
WP/SRC Chairman

GPG Report on
Safety of General Cargo Ships

Contents

1. Introduction.

Following from the proactive initiative taken with respect to Bulk Carrier Safety, IACS Council focused attention on the safety of General Cargo Ships and published "General Cargo Ships Guidelines for Surveys, Assessment and Repair of Hull Structure" in May 1999. In association with this, an analysis of LR's casualty Database was initiated by Council at the C39 Meeting and GPG were given the following terms of reference:

- if the analysis identifies the need for enhanced surveys this could be difficult to implement in view of the nature of this segment of the industry. Owners of bulk carriers and tankers were, to a degree, driven to accept the Enhanced Survey Program by external pressures. General cargo ship owners are different and will be much more difficult to pursuade to expend additional fees on additional surveys.

- Council considered that a strategic approach was needed to the question of general cargo ship casualties and that IACS should learn from previous mistakes, talk to the industry (sector involved) and differentiate between the different types of general cargo ships. For example, container ships may not be a cause of concern. It was also reiterated that daily maintenance on board is the most important factor in mitigating general cargo ship maintenance and that members should be urging this upon owners.

- Council decided that a GPG Small Group undertake a preliminary assessment as already agreed at GPG 46, initialize the work in line with the established plan on the evaluation and analysis of the casualty data, and report its outcome in good time to C40.

2. Actions undertaken by GPG

In pursuance of the C39 decision, a GPG Small Group was established and comprised representatives from ABS, BV, DNV, KR, LR, NK and IACS Secretariat. The Small Group has met twice, on 19 August 1999 in London and 12 October 1999 in Berlin, and the subject has been further discussed at GPG 47 and 48. The findings and recommendations of the Small Group, as endorsed by GPG, are given in this report.

Following GPG 47 and C 40 (December 1999), WP/SRC was tasked to, first, study means to identify ships carrying logs which are prone to extensive damage and rapid deterioration due to normal loading procedures and, second, to develop additional survey requirements for application at the periodical survey.

In addition, GPG submitted to Council 40th meeting a White Paper for WP/S describing the current status of general cargo ship safety issue, the need to develop a new UR for new log carriers with emphasis upon its political implications. As a consequence, Council tasked GPG to investigate steps regarding the construction of new ships carrying logs, based on the last paragraph of the White Paper which reads:

> "To create classification rules for construction of new ships carrying logs as a special type would be a major commitment by IACS Members and Council's views whether this is justifiable or not are requested by GPG."

In the course of deliberations on this topic, GPG has gone through the following three steps for LR's casualty data analysis:

- 1st tier analysis: high level analysis in long term trend for 18 years from 1980 – 1998 on all ship types of not less than 1,000 GT versus general cargo ships, tankers, bulk carriers and all ships other than general cargo ships to show both "first event non contact incidents" and "all incidents irrespective of causes" ;

- 2nd tier analysis: break down of casualty analysis of ships not less than 1,000 GT for ten years from 1998-1999 in three categories, i.e. hull failure, machinery/equipment failure, fire/explosion,

- third tier analysis: break down of casualty of all incidents from 1987-1998 for ships not less than 1,000 GT. This included analysis of narrative casualty data of the incidents of general cargo ships.

3. GPG 49 decisions (11-13, October 2000, Tokyo)

The most recent benchmark for IACS actions taken was conclusions drawn at GPG 49 meeting which was held on 13-15 October 2000 in Tokyo, which are summarized hereunder:

The principles applied in the course of decisions made before and during GPG 49 was:
- strengthening survey requirements for general cargo ships

- grouping ships not only by age but by size, if new survey requirements are to be developed.

GPG discussed a scope of task to be given to WP/SRC, based on LR's statistical data embracing the first and second tier analysis and narrative of casualty data for the third tier analysis. LR's own conclusions are summarized underneath Fig. 9 of section 4 of this report (9/18 page). Against LR's view that there was no distinction between ship sizes and types for which new survey requirements might be developed, a general consensus was that certain type of ships are not prone to lack of maintenance problems as others, therefore, can be easily excluded. Consequently, it was decided to task WP/SRC to develop ESP requirements for Special Survey No.3 and subsequent surveys as a UR Z10.5 for cargo ships carrying solid cargoes and having SOLAS SC Certificate other than:

- vessels subject to Z 10.2;
- dedicated container carriers;
- ro-ro cargo ships;
- pure car carriers;
- refrigerated cargo ships;
- dedicated wood chip carriers;
- dedicated cement carriers,
- barges.

It should be noted that the target of this task has been specified to ships holding SOLAS Safety Construction (SC) certificate. GPG's desire was expressed for WP/SRC to have a fresh look at the target ship types and not extrapolate the ESP applicable to large ships.

The relevant WP/SRC Task 82 Form A is attached to this report as Annex 1, which will replace the previous WP/SRC Task 73 to identify *ships carrying logs* for additional survey requirements.

As a byproduct of this study, GPG also paid its attention to machinery failure including flooding incidents and decided that WP/SRC should be tasked to investigate whether additional survey requirements are necessary to address machinery failures and engine room flooding problems of *all types of ships*, with a view to an amendment to UR Z 7. The relevant WP/SRC Task 83 Form A is attached as Annex 2.

4. Casualty Statistics (provided by LR for GPG 49 discussion)

Lloyd's Register's Maritime Information Publishing Group (MIPG) maintains a casualty database which is comprised of information collected from multiple sources worldwide. However, this database is dependent on casualties being "reported". Experience over many years has shown that, in some parts of the world, there is a lack of reporting on casualties of small ships. It has been established that poor reporting on general cargo ships of less than 1000 GT would bias the "rate of risk" statistics and these have not been included in the analysis. There are about 7000 general cargo ships of less than 1000 GT. Thus, this leaves about 10,0000 general cargo ships to be considered in the statistical analysis.

In order to establish the primary focus of the work it was decided to examine Actual Total Losses (ATLs) based on first event, non-contact (thus possible class related) ship casualty incidents for ships above 1000 GT. The results are shown in Figures 1, 2 and 3.

Figure 1 shows the average yearly ATL rate per 1000 ships at risk for each 5-year period from 1980 to 1994 for all ship types and general cargo ships. It shows a decreasing tendency from the first five years to the second five years and an almost imperceptible decreasing tendency for the next five-year period.

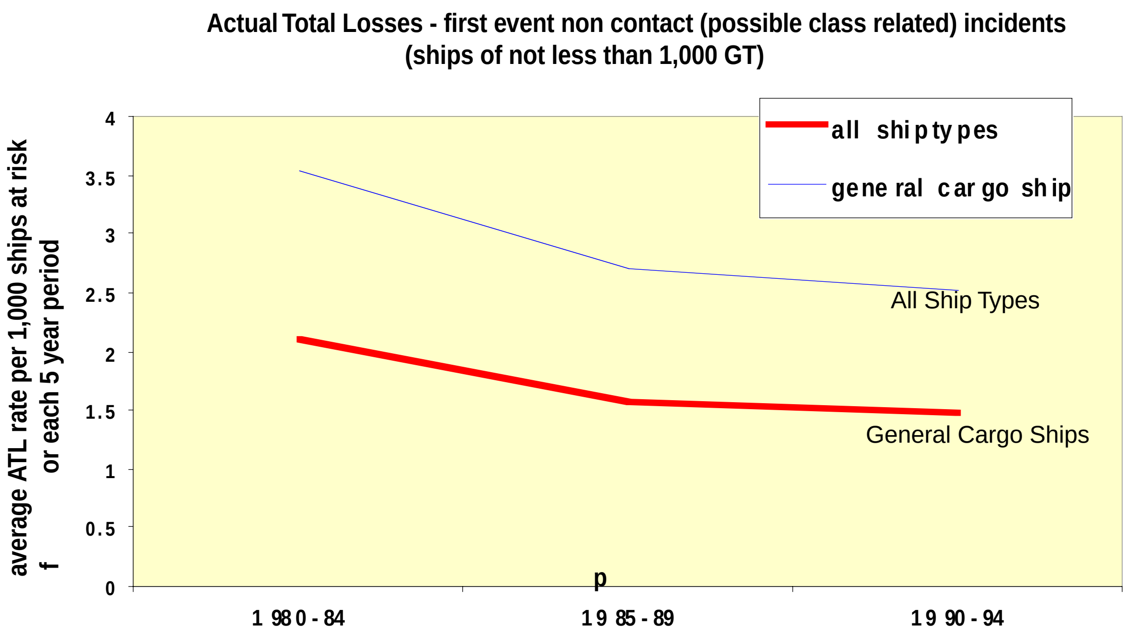

Figure 1

Figure 2 gives bar charts of an average yearly ATL rate per 1000 ships at risk for the entire 15-year period of the world fleet and the IACS fleet for all types and general cargo ships. There is no significant difference between the world fleet and the IACS fleet. Since the possible bias from non-reporting has been eliminated by exclusion of ships less than 1000 GT, the chart only indicates that IACS Members class the majority of the world fleet and that Members have an annual loss rate of about 26 general cargo ships.

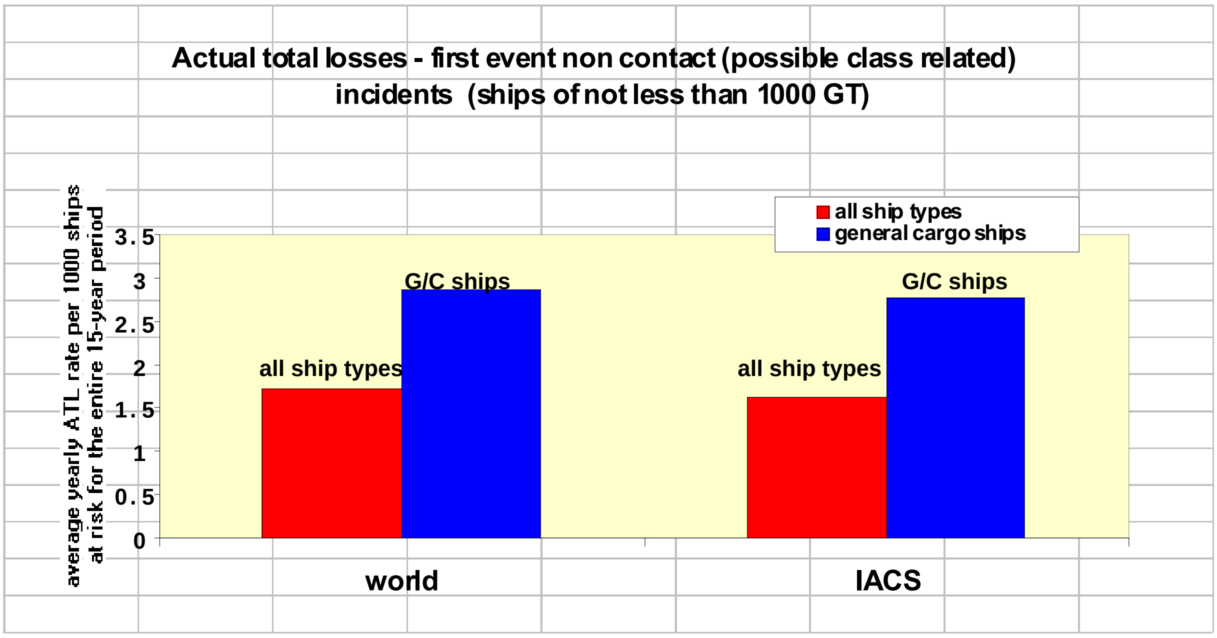

Figure 2

Figure 3 shows the average yearly ATL rate per 1000 ships at risk for the entire 15-year period in five yearly age blocks. There is a sharp increase of the ATL rate on the second age group (5-9 years) with a steady sharp increase to the age group of 15-19 years. A steady ATL rate of 4.5 ships per 1000 ships is shown for the age group of 15-19 years and above for general cargo ships. This chart establishes a direct relationship of increasing risk with a vessel's age and that general cargo ships are more at risk than other ship types.

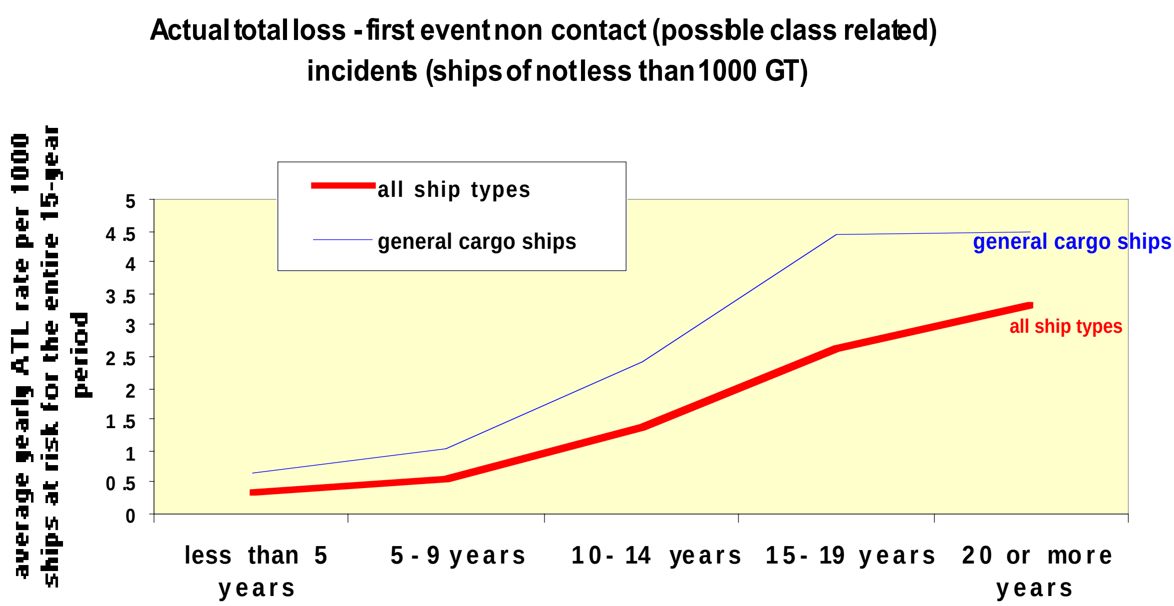

Figure 3

For comparative purposes the average yearly loss rates for various ship types are shown in the following figures, numbers 4 to 9:-

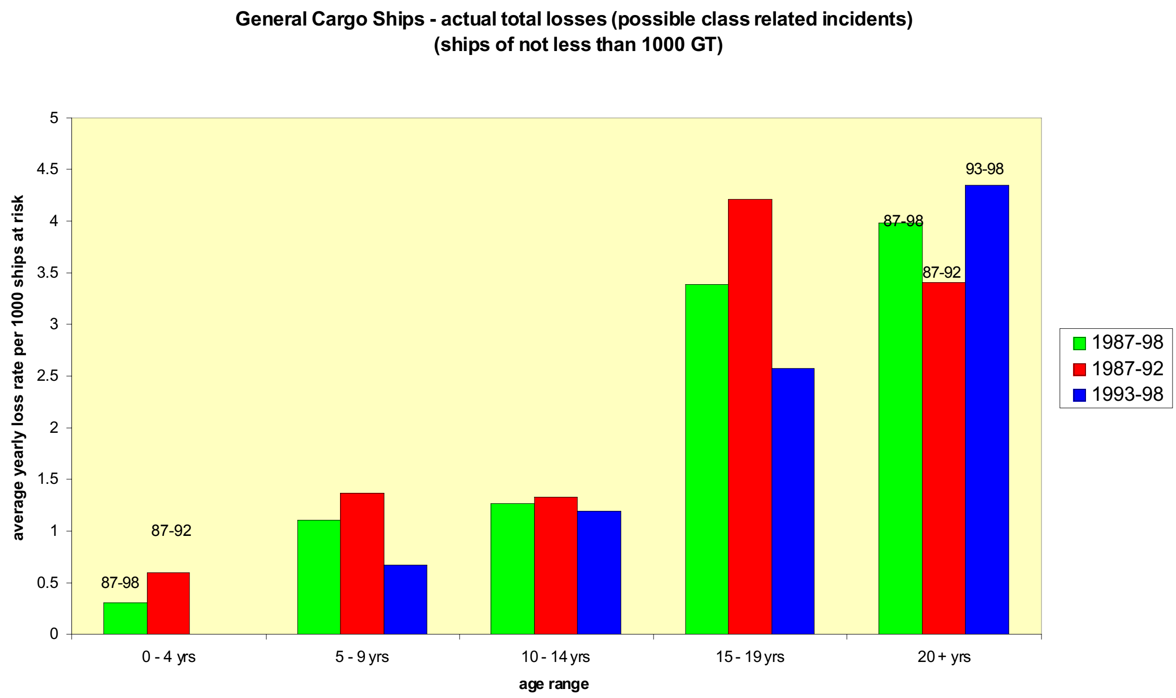

Figure 4 - General Cargo Ships (greater than 1000 GT)

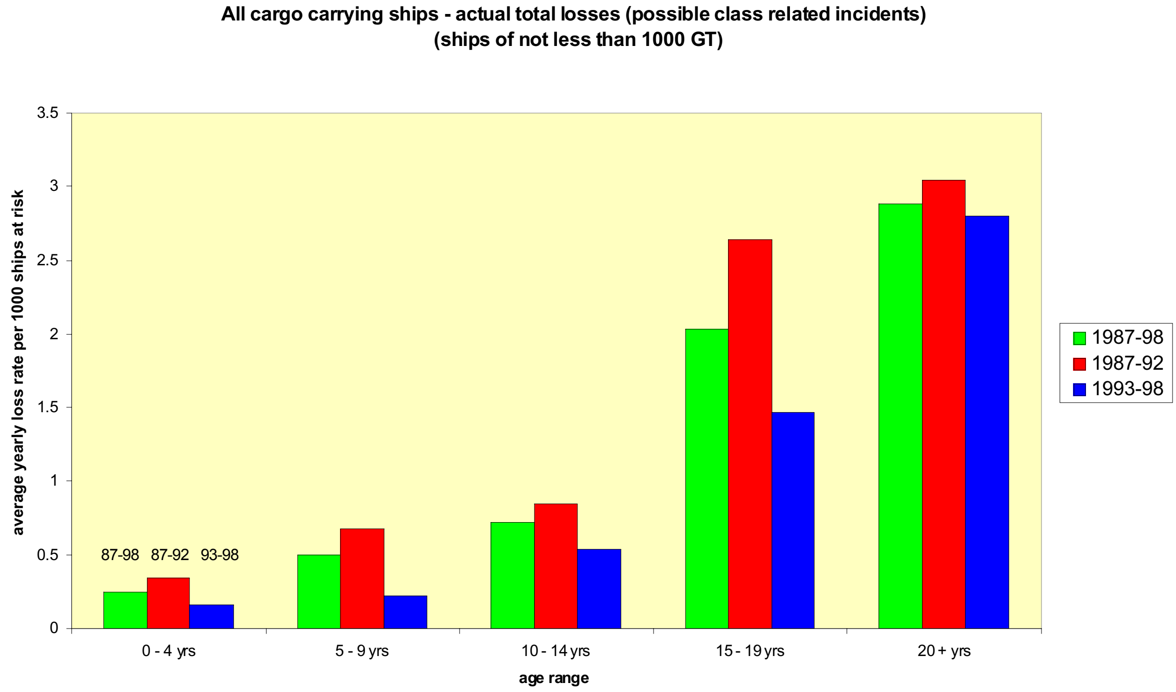

Figure 5 - All cargo carrying ships

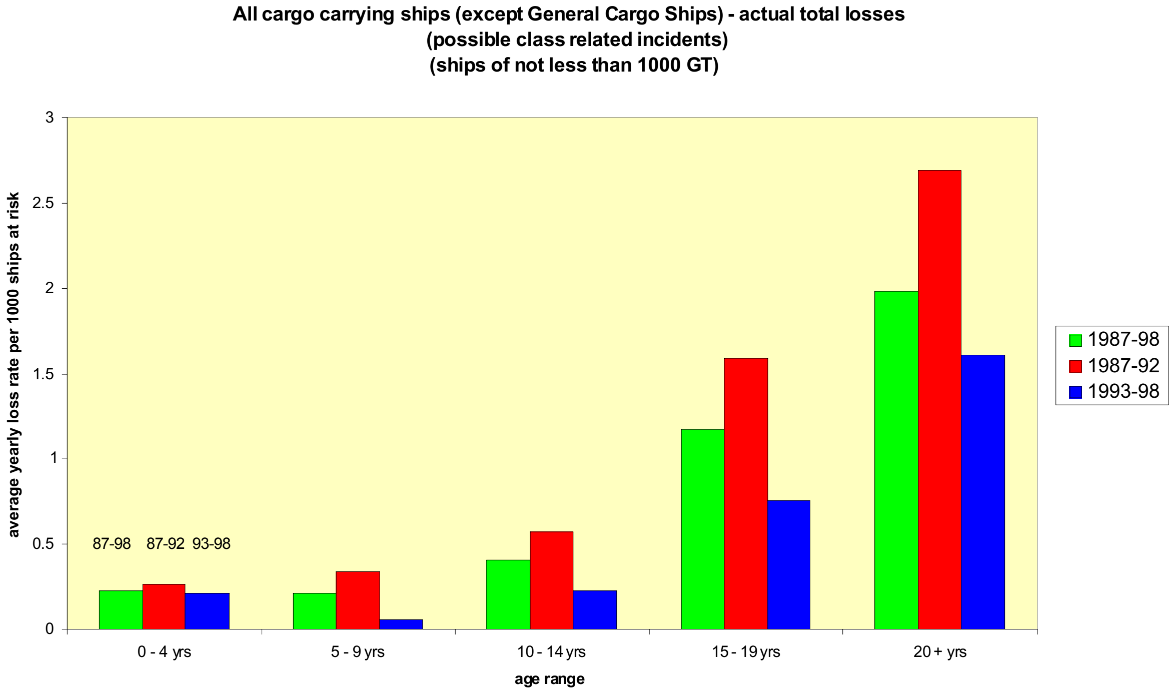

Figure 6 - All cargo carrying ships (except general cargo ships greater than 1000 GT)

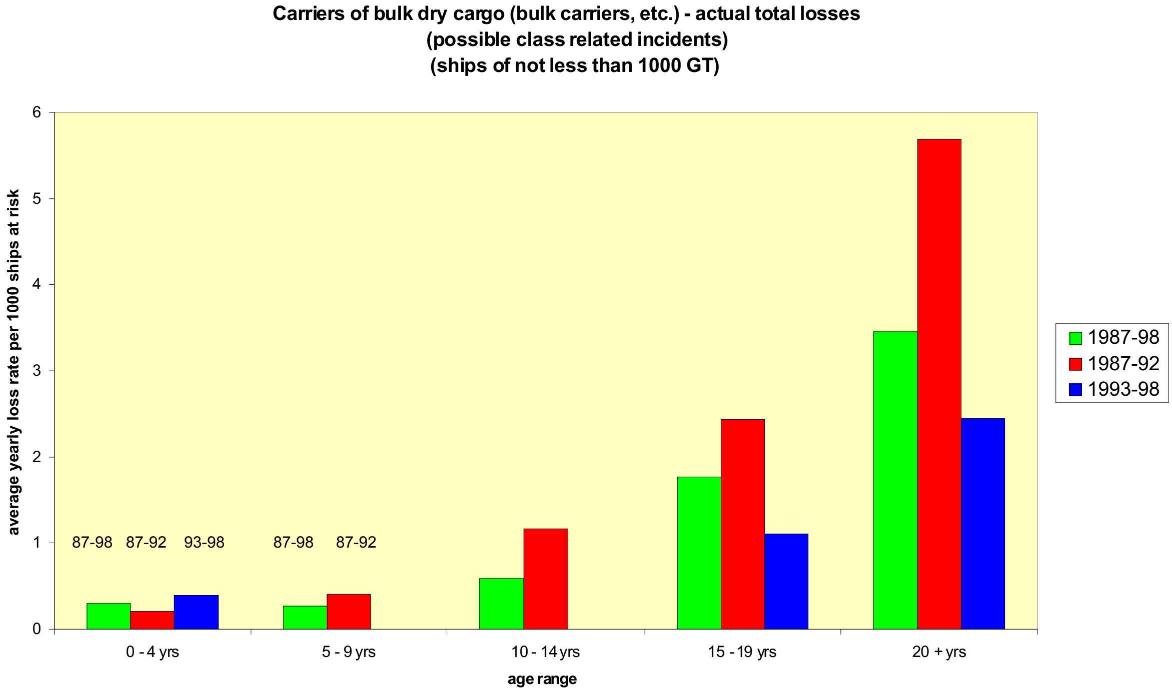

Figure 7 - Bulk Carriers

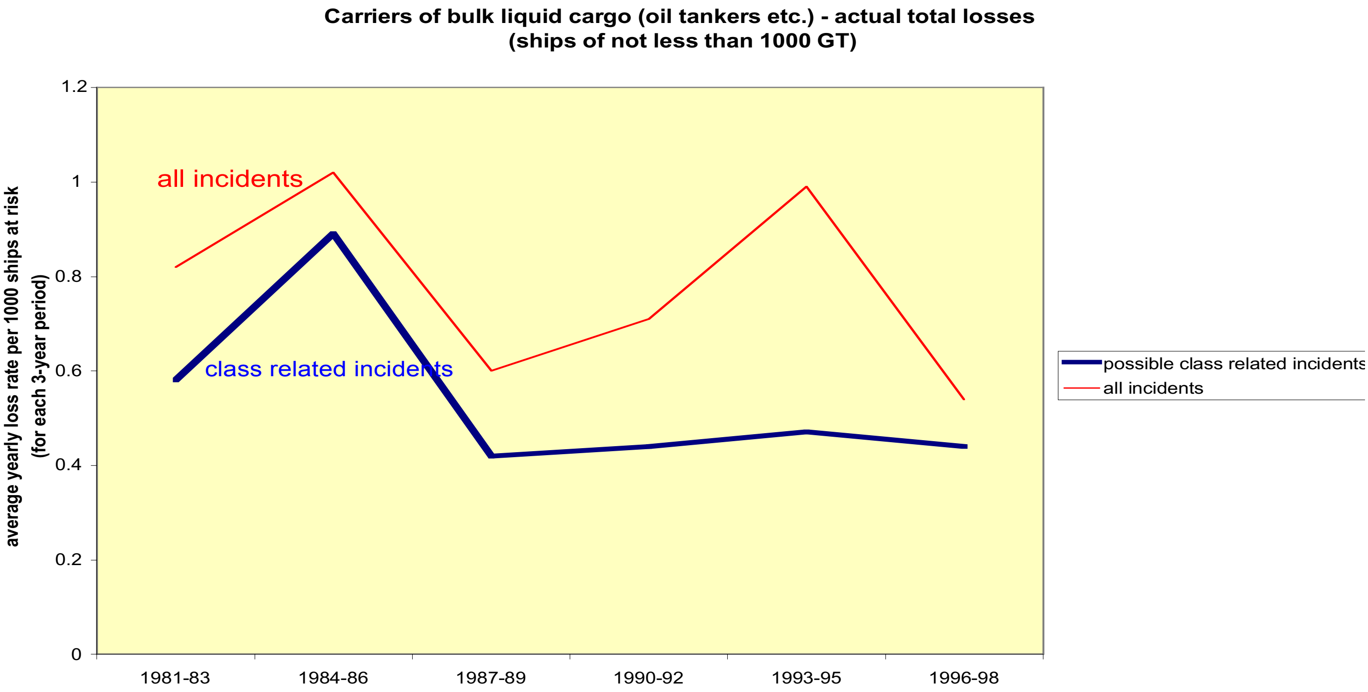

Figure 8 - Bulk liquid cargo carriers (tankers)

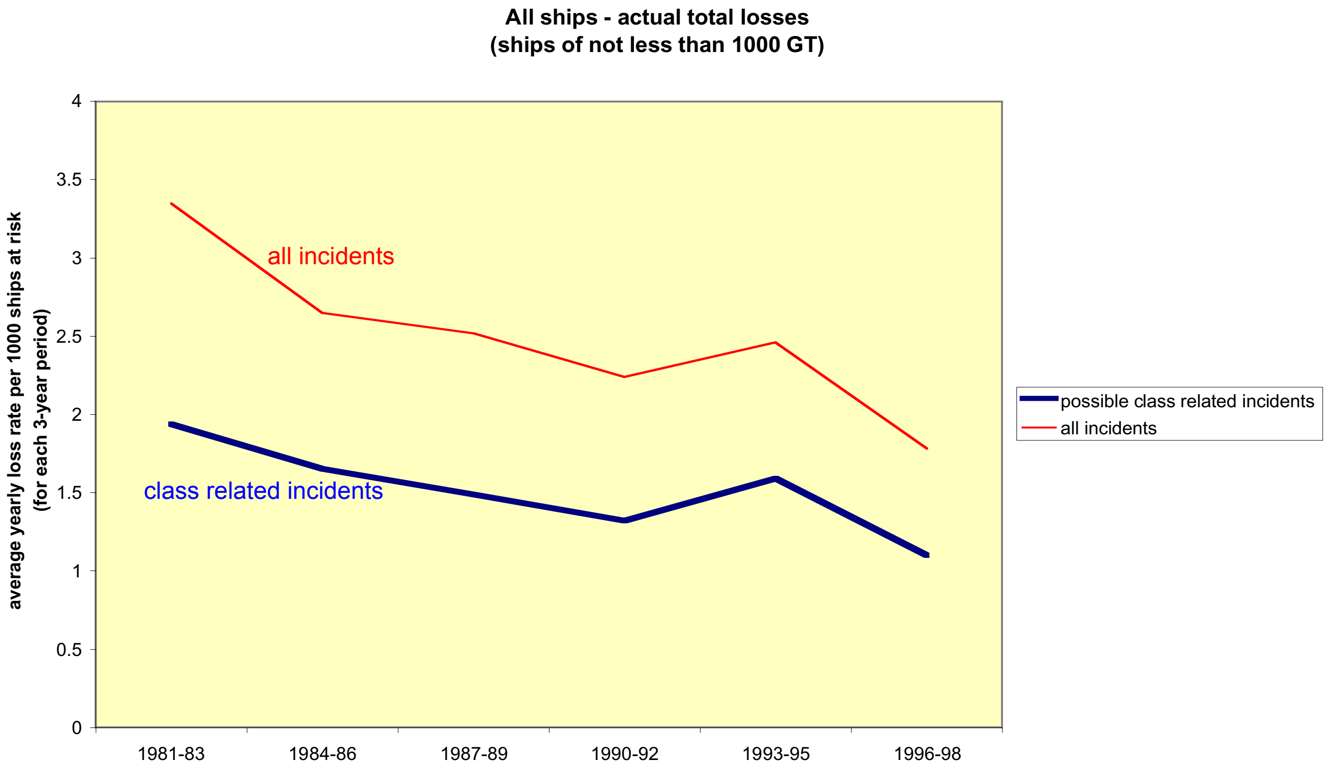

Figure 9 - All ships ATL

In general, the foregoing figures indicate that general cargo ships have a loss rate of up to four times that of other cargo-carrying ships and nearly three times that of dry bulk carriers, the next most at risk group. In addition, although the loss rates for general cargo ships decreased steadily in the 1980’s and early 1990’s, there has been no corresponding decrease in the mid to late 1990’s.

This statistical evidence confirms the need for IACS action in respect of enhancing the existing hull survey regime for general cargo ships once they reach [10 or 15] years of age.

However, in proposing an enhanced survey regime, it was also clear that a more detailed study of all the available casualty narrative texts could assist the determination of more precise survey requirements if these could be focused, where possible, on the root cause the reported incidents. A further objective of this third tier analysis was to identify, in as much detail as possible, any trends and/or key areas that could be addressed in the short and medium term to enhance the safety of general cargo vessels.

The available statistical data on general cargo ship incidents addresses 1942 incidents during the period between 1987 to 1998 during which the number of people killed or missing was reported as 1344. Further analysis of the data has indicated the following :

(1) the age of a vessel is not the only factor when investigating the potential for serious vessel incidents to occur.
(2) the nature of the key trends/areas identified are common to most vessel types.
(3) three key areas need to be simultaneously addressed:
    - machinery/equipment failure
    - hull related incidents
    - fire/explosion incidents.
(4) the integrity of main engines and their associated systems, the integrity of machinery spaces with respect to flooding and fire/explosion damage and the integrity of hull structures in the forepart of general cargo vessels all need to be urgently addressed.
(5) increased survey requirements in the areas identified in (3) above need to be supported by both improved design criteria and an improved maintenance monitoring programme to be effective.

LR suggests that IACS should focus its attention in the three core areas identified and considers that an overall enhanced survey program for general cargo ships focused in this way is likely to be more effective in the short to medium term~~.~~

The first tier analysis concentrated on ATLs and, as Figure 10 shows, the cause of the majority of ATL incidents may be associated with Class Related issues. Hull failure was also identified as a major area for further investigation with respect to ATLs.

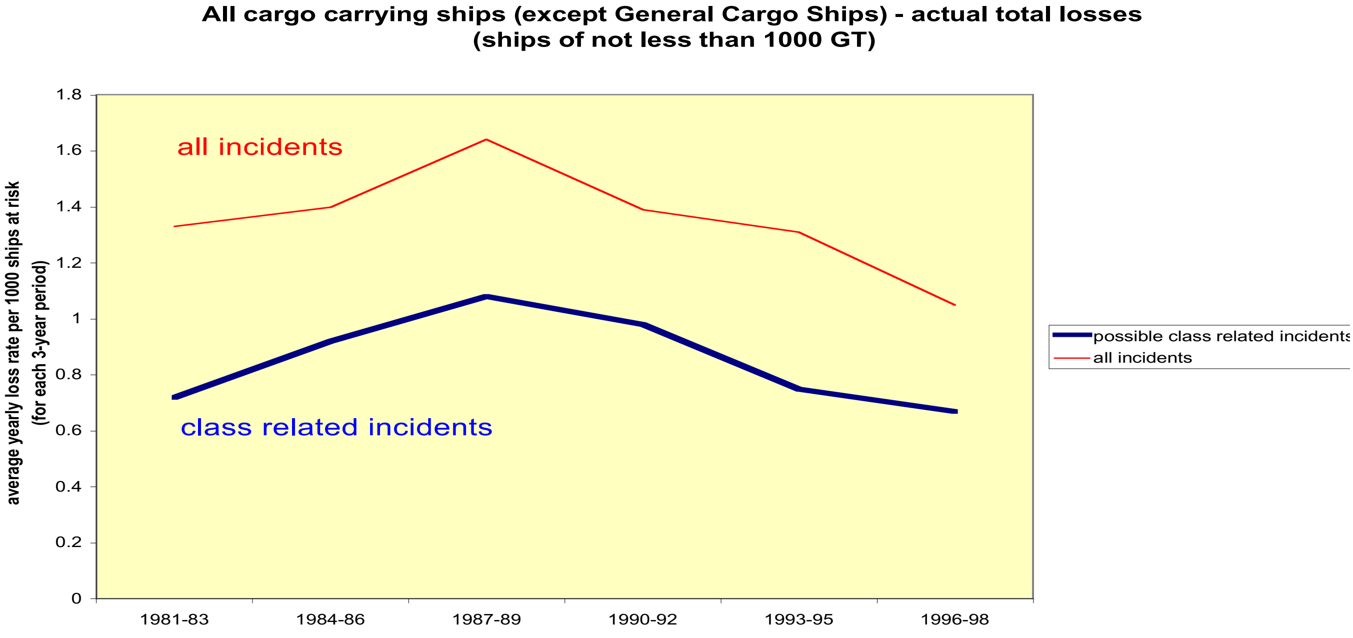

Figure 10

The results of the second tier analysis also concentrated on ATLs and identified three primary areas to be addressed: hull failures, machinery/equipment failures and fire/explosion incidents. Figure 11 shows the relative proportion of such incidents in the data examined.

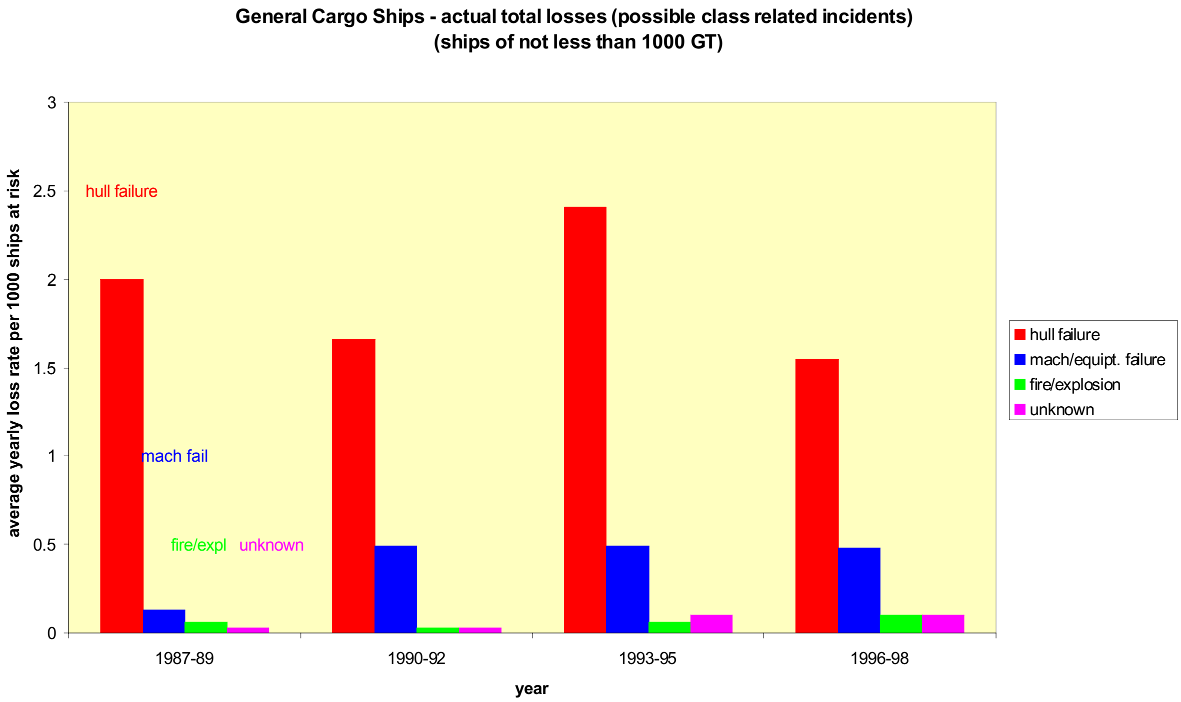

Figure 11

Unlike the previous studies the third tier study considered all the incident data that was reported. For those incidents where all the relevant facts have not been reported no assumptions have intentionally been made to identify the cause of the incident. Only the facts as report have been used. Unfortunately, the level of detail provided with the many of the incident reports is such that any further analysis beyond that contained in this Report would be inconclusive.

In addition to further supporting the results of the ATL study, and despite the limitations of the data used, specific areas which need attention to enhance the safety of general cargo vessels were clearly identified.

Previous work on this subject suggested a direct link between incident rate and the age of a vessel. Figures (12) and (13) show the number of incidents for each vessel age group and the percentage of those incidents which resulted in an ATL. Total Losses have occurred across the full age profile, however, the percentage of CTLs and ATLs in each age group does increase as the vessel age increases and this confirms that vessel age is a contributing factor.

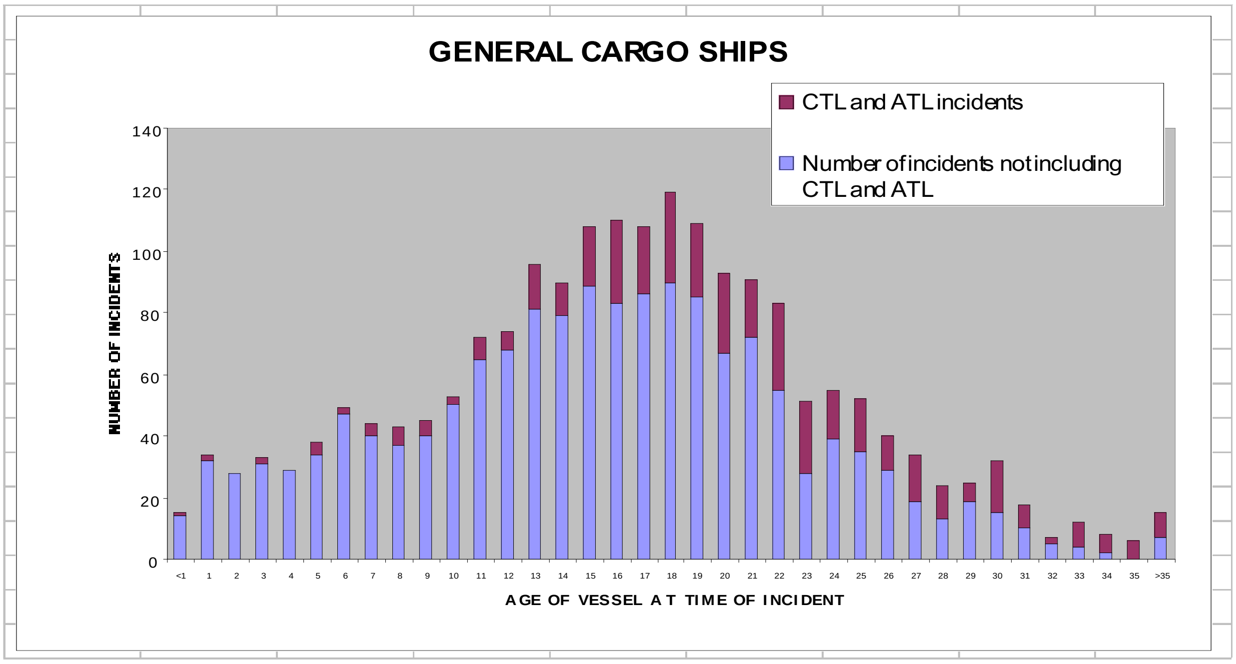

Figure 12

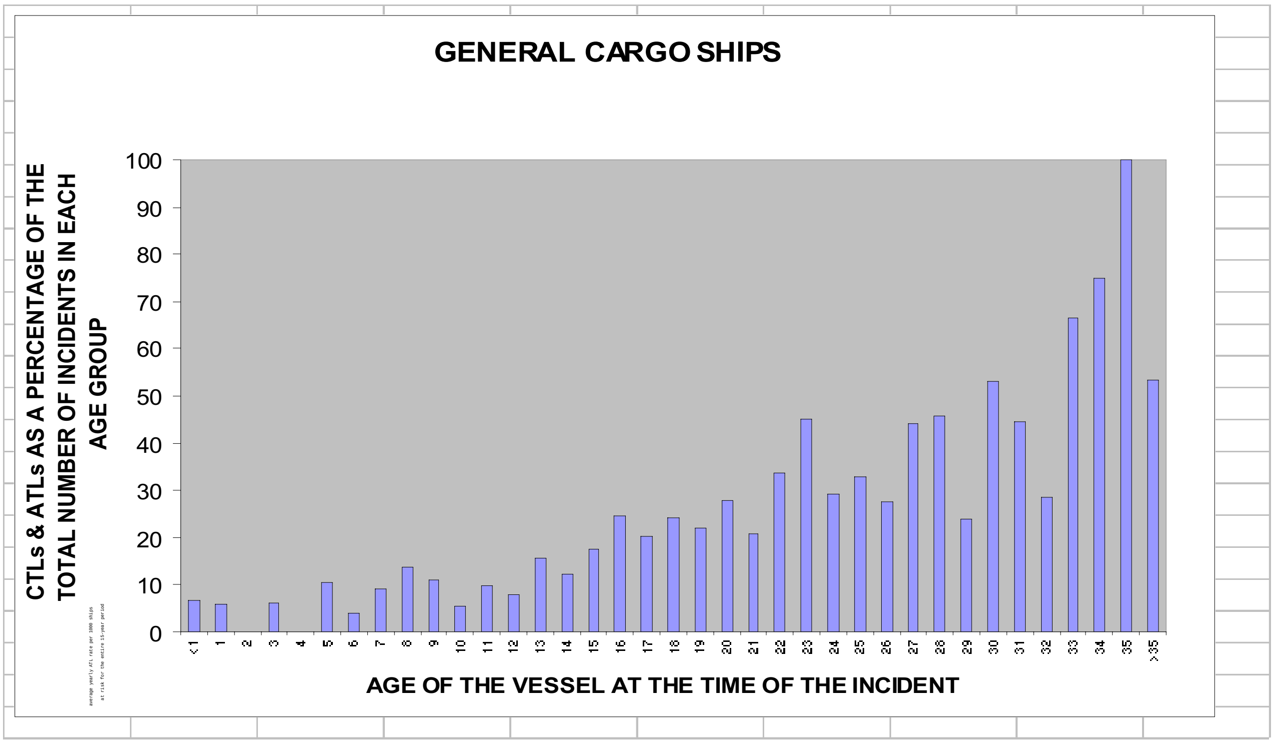

Figure 13

Figures (14A & 14B) reflect the general age profile of general cargo vessels worldwide. However, the results also indicate that serious incidents of a similar nature to those associated with total losses can occur on any vessel irrespective of the age of the vessel. These phenomena would suggest that other influencing factors such as vessel design, maintenance and operation are also direct contributing factors.

Figure 14B

The third tier analysis confirmed that the previously identified three key areas of concern are still valid. The variation of the relative weighting of each key area is shown in Figure (15), and although different from that seen in the second tier analysis, is indicative of the whole incident data base now being used. The important feature of this incident profile compared with previous profiles is the high frequency of reported machinery/equipment failures.

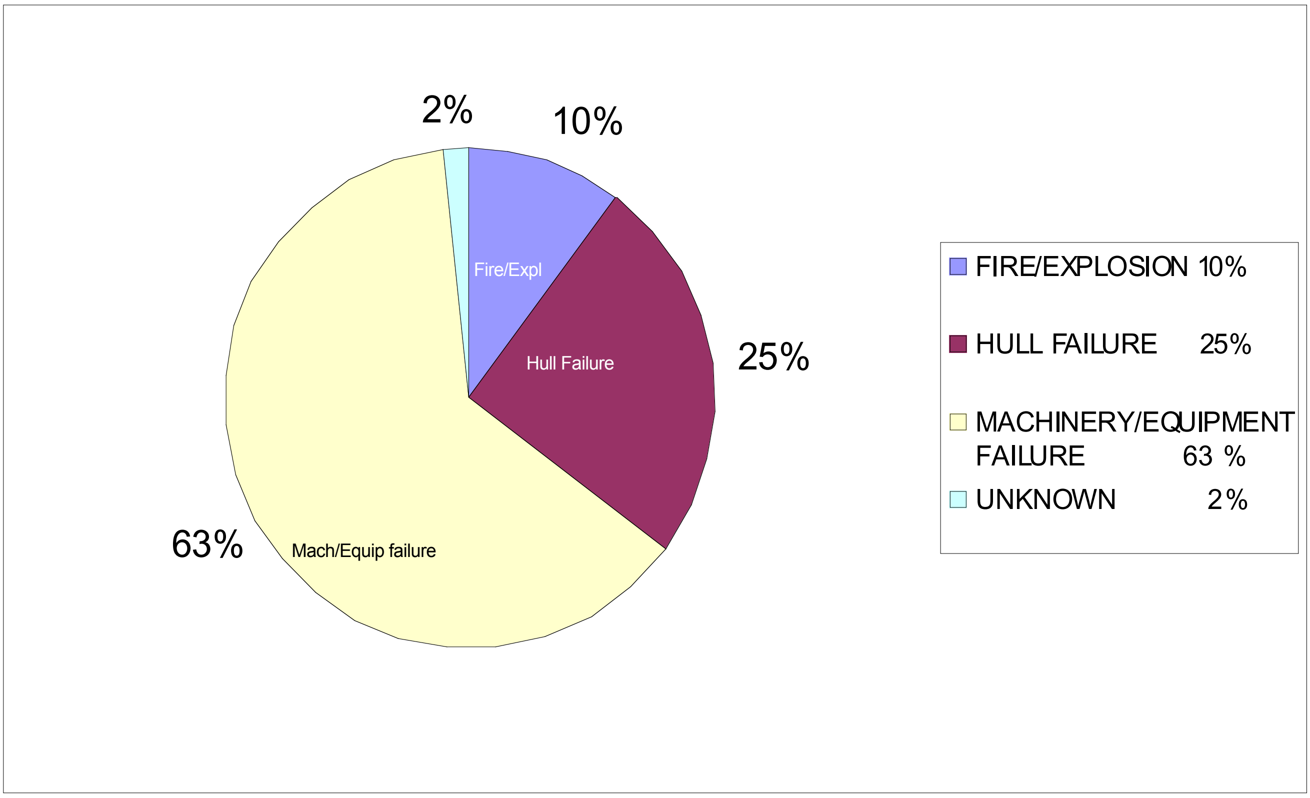

Figure 15

The third tier study focused on each of the above key incident areas.

(1) Hull Related Incidents.

The number of incidents associated with hull related issues are 488 compared with 1224 with machinery/equipment. The profile of hull related incidents are shown in the Figure (16). Heavy weather damage accounted for 204 incidents i.e. 42%. Of the majority of the 71 vessels reported lost (foundered/disappeared) no information on the cause of the incident was provided. This is also the case with the majority of the 53 incidents associated with flooding where details of the cause and/or the location of the flooded area were not provided. Of particular significance is the number of incidents associated with engine-room damage and hold damage. Figure (16) also indicates that the integrity of the bow structure, forepeak and forward holds are areas where improvements in structural integrity, inspection and maintenance programs are needed.

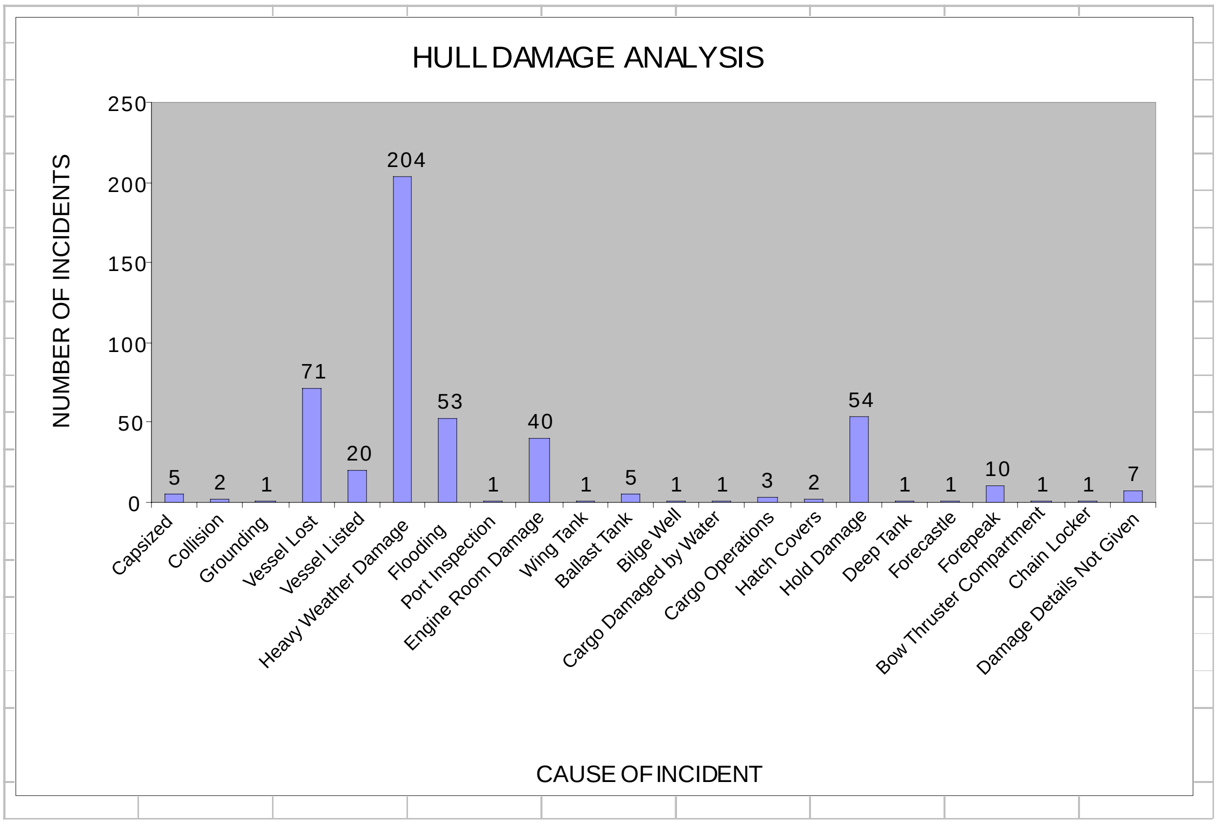

Figure 16

Figure (17) shows the profile of 204 hull-related incidents associated with heavy weather damage and again flooding, machinery and hold-related incidents predominate.

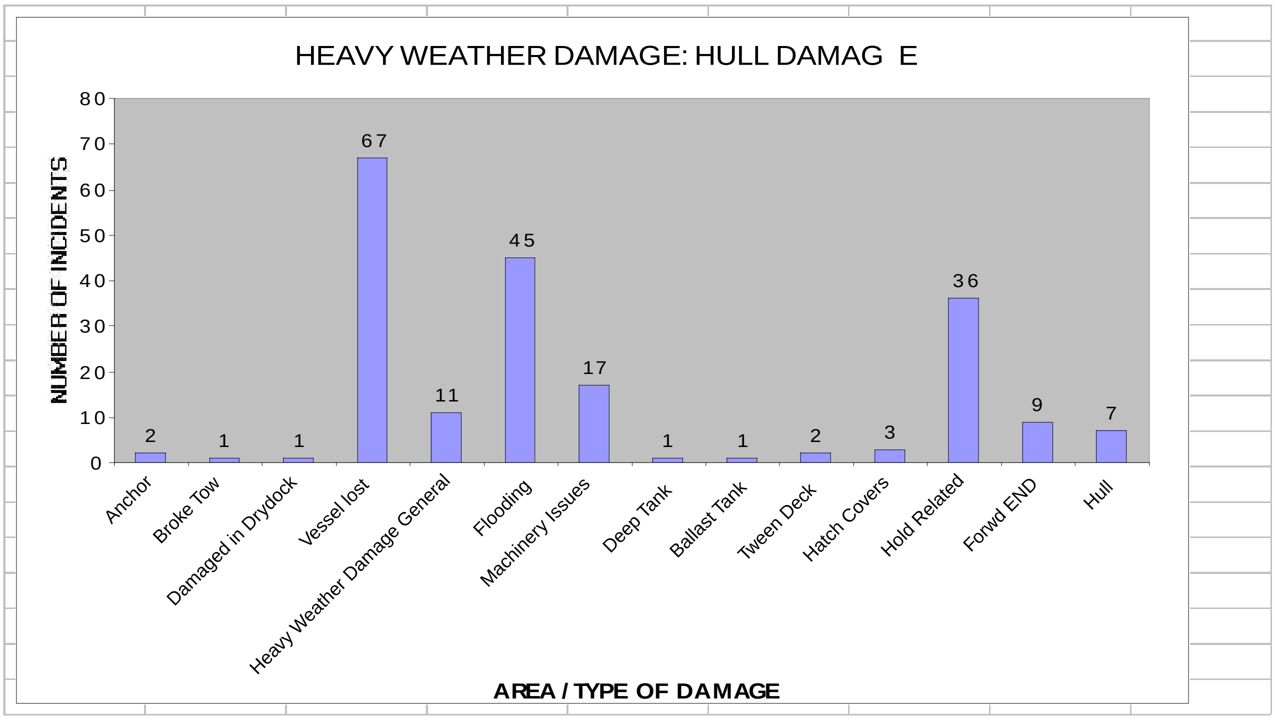

Figure 17

The majority of the engine room area hull related incidents were engine-room flooding (46) compared with 7 incidents associated with main engine failure. (see Figure 18) The available details relating to the flooding incidents, although limited, does suggest that the integrity of the engine room hull fittings and salt water cooling lines and the inspection of engine room load-line issues need to be better addressed.

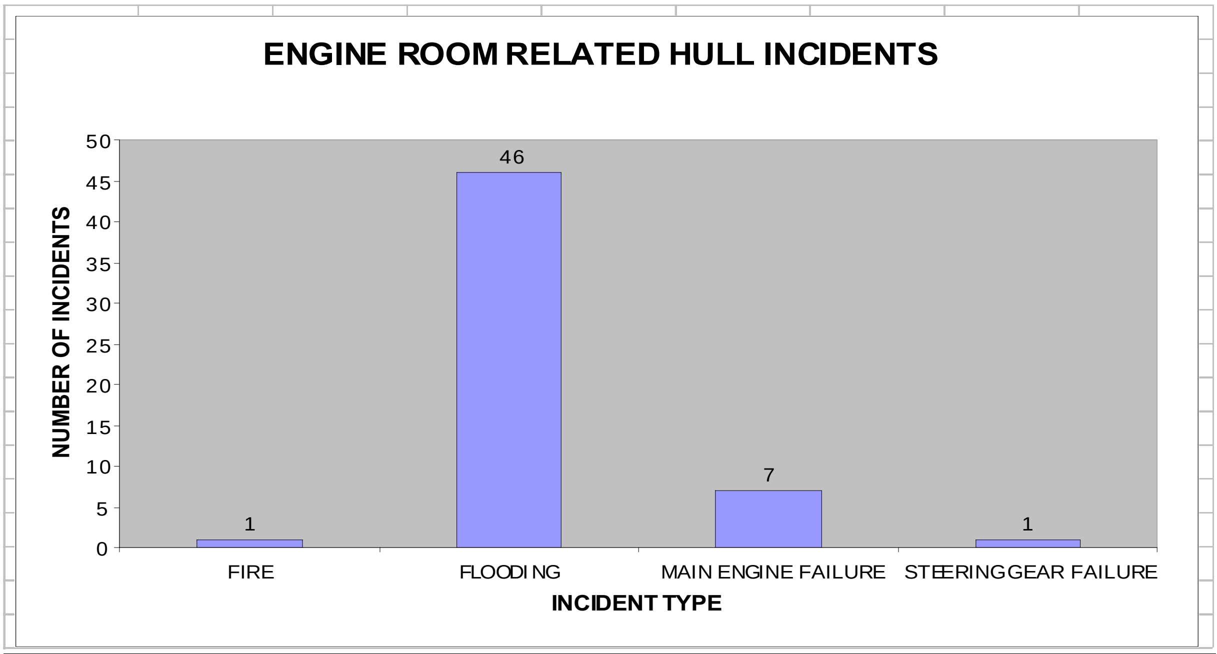

Figure 18

The incidents associated with hold damage were examined in more detail. Of the 90 incidents reported 36 were associated with heavy weather conditions. The type and location of the hold damage (including heavy weather damage) is shown in Figure (19). Although there are 24 cases where the locations of the hold damage/flooding have not been given the remaining data clearly indicates that the frequency of hold damage/flooding is greater in the forward areas of the vessel. This trend is also seen when the hold damage incident data is re-examined without the heavy weather incident data.

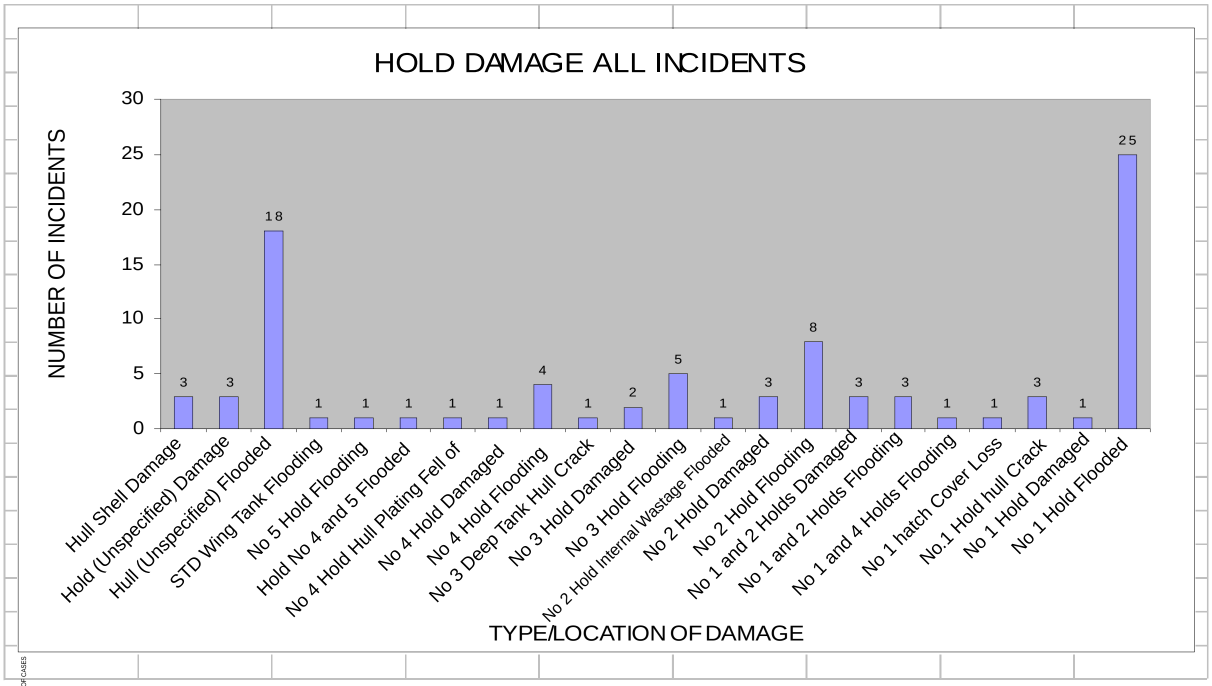

Figure 19

(2) Machinery/Equipment Related Incidents.

There are 1224 incidents on the database associated with machinery/equipment failure of which 794 (65%) are related to the operation of the main engine. (see Figure (20)). Of these main engine related incidents 16% can be attributable to mechanical failure and 5% are associated with heavy weather conditions. Unfortunately the cause of the remaining 79% main engine failure incidents has not been specified in the incident reports.

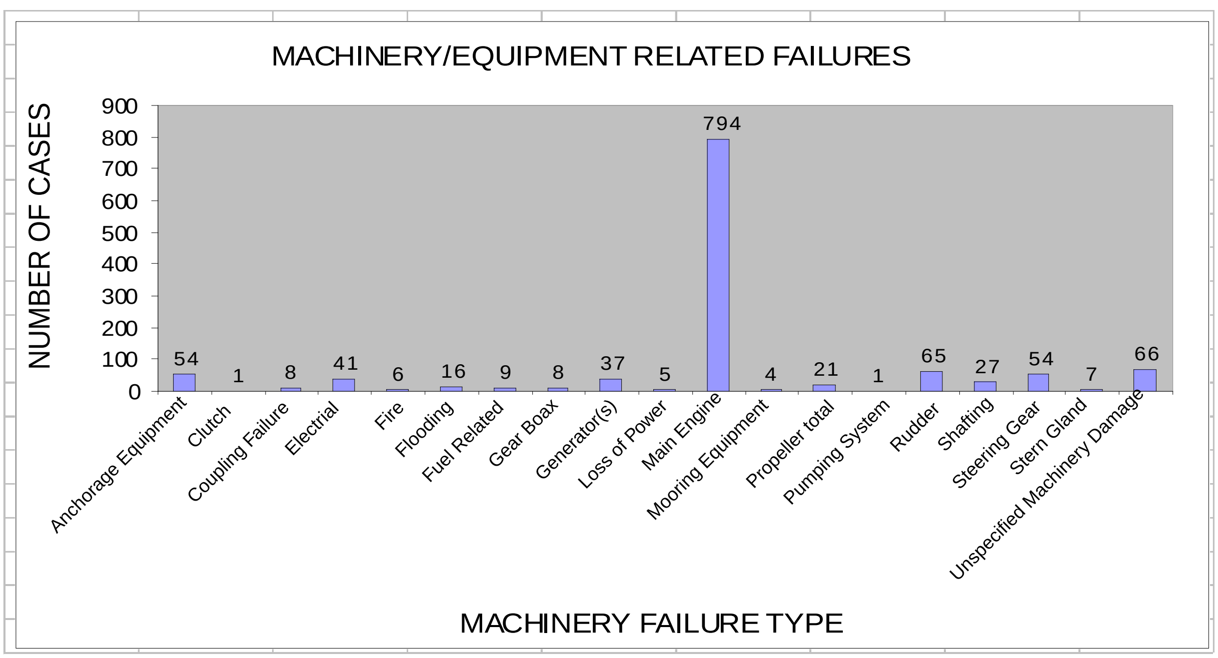

Figure 20

(3) Fire and Explosion Damage Incidents

Figure (21) shows the location of the 198 fire/explosion related incidents reported. The majority of such incidents (72%) have occurred in the engine room and 21% in the cargo holds. The lack of detail in the majority of these cases did not allow any further accurate observations to be made. However, the trend clearly shows that there is a need for greater attention to fire safety issues in engine room spaces.

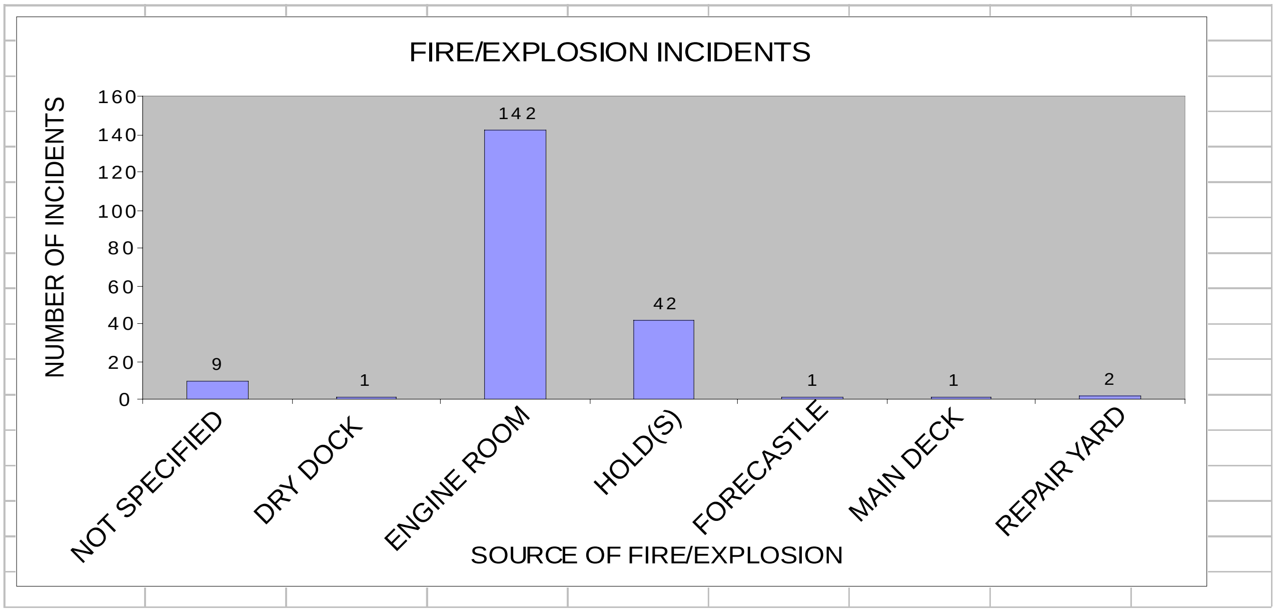

Figure 21

UR Z11 "Mandatory Ship Type and Enhanced Survey Programme (ESP) Notations"

Summary

In Rev.7 of this UR, an update was made to exclude chemical tankers constructed with independent cargo tanks only from ships to which the "ESP" notation shall be assigned.

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Rev.7 (Feb 2025)	13 February 2025	1 January 2027
Rev.6 (May 2023)	24 May 2023	1 July 2024
Rev.5 (Sept 2015)	21 September 2015	1 January 2017
Rev.4 (Mar 2011)	11 March 2011	1 January 2012
Rev.3 (July 2004)	13 July 2004	1 January 2005
Rev.2 (June 2000)	15 June 2000	-
Rev.1 (1996)	*No record*	-
New (1993)	*No record*	-

- ### Rev.7 (Feb 2025)

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

A decision was made to exclude chemical tankers constructed with independent cargo tanks only from vessels to which the "ESP" notation shall be assigned in consideration of the previous revision of this UR made to Para. 2.1 for oil tankers.

3 Surveyability review of UR and Auditability review of PR

Survey Panel has agreed to this revision.

4 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

5 History of Decisions Made:

Survey Panel initiated consideration of the need for exclusion of chemical tankers constructed with independent cargo tanks only from vessels to which the "ESP" notation shall be assigned in consideration of the previous revision of this UR. Survey Panel agreed to update Para. 2.6 of this UR to exclude such chemical tankers.

No TB is expected for the present revision.

6 Other Resolutions Changes:

None

7 Any hinderance to MASS, including any other new technologies:

None

8 Dates:

Original Proposal	: 18 October 2024	(Ref: PSU24045_ISUa)
Panel Approval	: 24 December 2024	(Ref: PSU24045_ISUd)
GPG Approval	: 13 February 2025	(Ref: 25014_IGb)

- **Rev.6 (May 2023)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

An update of this UR to maintain the consistency with UR Z10.1 and UR Z10.4.

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

4 History of Decisions Made:

IACS decided to update this UR to maintain the consistency with the outcome of previous work related to definitions of oil tankers reflected in UR Z10.1(Rev.25) and UR Z10.4(Rev.18).

5 Other Resolutions Changes:

None

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal	: 20 February 2023	(PSU23009_ISUa)
Panel Approval	: 15 March 2023	(Ref: 37th Survey Panel Meeting)
GPG Approval	: 24 May 2023	(Ref: 23079_IGb)

- ## Rev.5 (Sept 2015)

1 Origin of Change:

☑ Based on the proposal of an IACS Member

2 Main Reason for Change:

Following a query made by a Panel Member seeking the advice whether the self-unloading ships, carrying and self-discharging solid materials in bulk, are to be considered as units subject to the Enhanced Survey Program (ESP).

3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

Survey Panel discussed the matter under PSU15019 and the majority of the Members agreed that a self-unloading ship is to be subjected to the ESP regime when it:

- is a self-propelled ship.
- is constructed generally with single deck, double bottom, hopper side tanks and topside tanks and with single or double side skin construction in cargo length area its midship section.
- is intended to carry and self-unload dry cargoes in bulk.

Panel Members concurred that notwithstanding the configuration (shapes) of the double bottom, of the self-unloading ship, might be different from that traditional, e.g. flat or slightly inclined toward the center line, this does not prevent the application of the ESP scheme.

According to the above Panel agreed to the modification of the UR Z11.
This has been modified by introducing the new category of ships (self-unloaders) which is inclusive of the sketches of the most typical sections.

No TB is expected for this revision.

5 Other Resolutions Changes

None

6 Dates:

Original Proposal: *17 March 2015 (Made by a Member)*
Panel Approval: 14 *August 2015 (Ref: PSU15019)*
GPG Approval: *21 September 2015 (Ref: 15139_IGc)*

- ## Rev.4 (Mar 2011)

1 Origin of Change:

☑ Suggestion by an IACS member

2 Main Reason for Change:

Since UR Z11 contains single hull arrangements, include a provision which states vessels that do not comply with MARPOL I/19 may be subject to International and/or National Regulations requiring phase out. Also, include double hull arrangements for "ORE/OIL CARRIER".

3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

Discussed at Spring 2010 Survey Panel meeting and completed through correspondence.

5 Other Resolutions Changes

None

6 Dates:

Original Proposal: 25 *February 2010* Made by: *Survey Panel*
Panel Approval: *October 2010*
GPG Approval: *11 March 2011 (Ref: 11039_IGb)*

- **Rev.3 (July 2004)**

To amend Z11 to take into account the adoption of URs Z10.4 and Z10.5, and amendments to UR Z10.2 relating to hybrid hold arrangements, clarification in respect of combination carriers and ore carriers and new definition of bulk carriers and double hulled oil tankers (WP/SRC Task 117).

See TB in Part B.

- **Rev.2 (June 2000)**

To reflect the IMO interpretation of 'single side skin construction' in the Z11.2.2 definition of a 'bulk carrier'. WP/S submitted the draft revision to Z 11. Approved by GPG 48.

See TB in Part B.

- **Rev.1 (1996)**

No TB document available.

- **New (1993)**

No TB document available.

Part B. Technical Background

List of Technical Background (TB) documents for UR Z11:

Annex 1 **TB for Rev.2 (June 2000)**

See separate TB document in Annex 1.

Annex 2 **TB for Rev.3 (July 2004)**

See separate TB document in Annex 2.

Annex 3 **TB for Rev. 4 (March 2011)**

See separate TB document in Annex 3.

Note: *There is no separate Technical Background (TB) document for New (1993), Rev.1 (1996,), Rev.5 (Sept 2015), Rev.6 (May 2023) and Rev.7 (Feb 2025).*

(Rev.2, Z11)

Technical Background to changes proposed in respect of Z11.2.2 Bulk Carriers

The objective of the proposal is to reflect the IMO interpretation of ‘single side skin construction’ in the Z11.2.2 definition of a ‘bulk carrier’. The Working Party on Strength discussions yielded unanimous agreement and no matters remain unresolved.

S E Rutherford
Chairman IACS WP/S

4th May 2000

Technical Background
UR Z 11 (Rev. 3)

1. Objective

To amend Z11 to take into account the adoption of URs Z10.4 and Z10.5, and amendments to UR Z10.2 relating to hybrid hold arrangements, clarification in respect of combination carriers and ore carriers and new definition of bulk carriers and double hulled oil tankers (WP/SRC Task 117).

2. Background

When approving UR Z10.5 and reviewing draft amendments to Z10.2 in 2003/2004, GPG found it necessary to amend UR Z11 in order :

- to take into account hybrid cargo hold arrangements in Z11 ;
- to introduce new definitions of bulk carriers, ore carriers and combination carriers;
- to clarify application of UR Z10s to various types of ships according to their hull arrangements.

3. Amendment

GPG tasked WP/SRC to amend UR Z11 accordingly. Task 117 given. Outcome reported on 11 May 2004 (4072bNVa).

[Due to the implementation date of Z10.5 being 1 January 2005, changes introduced in Rev.3 to Z11 are to be implemented from 1 January 2005]

2 July 2004
Prepared by the Permsec

Technical Background for UR Z11 Rev.4, Mar 2011

1. Scope and objectives

Since UR Z11 contains single hull arrangements, include a provision which states vessels that do not comply with MARPOL I/19 may be subject to International and/or National Regulations requiring phase out. Also, include double hull arrangements for "ORE/OIL CARRIER".

2. Engineering background for technical basis and rationale

N/A

3. Source / derivation of the proposed IACS Resolution

IMO MARPOL Annex I Regulation 19

4. Summary of Changes intended for the revised Resolution:

A provision was added for each which states vessels that do not comply with MARPOL I/19 may be subject to International and/or National Regulations requiring phase out. Also, include double hull arrangements for "ORE/OIL CARRIER".

5. Points of discussions or possible discussions

None

6. Attachments if any

UR Z13 “Voyage Repairs and Maintenance”

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Rev.3 (Jan 2011)	05 January 2011	1 July 2011
Rev.2 (Feb 2010)	11 February 2010	1 January 2011
Rev.1 (1995)	*No Record*	-
NEW (1995)	*No Record*	-

- **Rev.3 (Jan 2011)**

.1 Origin for Change:

☑ Suggestion by an IACS member

.2 Main Reason for Change:

A member queried the definition of ‘extreme’ in the phrase ‘extreme emergency circumstance’. The phrase was introduced in Rev.2 to Z13. The document MSC/Circ.1070, upon which the amendments in Rev.2 were based, does not refer to ‘extreme emergency circumstances’. It was therefore decided to delete the word ‘extreme’, referring only to ‘emergency circumstance’.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

The matter was raised by the member prior to the Autumn Survey Panel Meeting, and discussed at the meeting. It was agreed that to define an ‘extreme emergency circumstance’ would be problematic, and in order to closer align Z13 with MSC/Circ.1070 it was agreed that the word ‘extreme’ should be deleted.

.5 Other Resolutions Changes

None

.6 Dates:

Original proposal: *September 2010 Made by a Member (PSU 10038)*
Panel Approval: *16 September 2010*
GPG Approval: *05 January 2011 (Ref. 10166_IGd)*

• Rev. 2 (Feb 2010)

.1 Origin for Change:

☑ Suggestion by IACS member

.2 Main Reasons for Change:

According to the fact that MSC/Circ.1070 substitutes MSC/Circ.807 and the latter is no longer valid, existing UR Z13 which has made reference to MSC/Circ.807 needs to be modified in order to correspond with MSC/Circ.1070.

.3 History of Decisions Made:

Hull Panel chairman advised Survey Panel chairman that UR Z13 may have to be revised in order to correspond to the requirements of MSC/Circ.1070 instead of MSC/Circ.807, which is no longer valid, via the e-mail, 'PH9018_IHa, Response to industry question - Mr Isbester - Application of MSC/Circ.1070' dated 10 September 2009. According to this e-mail, the panel members discussed about this issue and the panel concluded that UR Z13 should be revised under Task 69 (PSU9031). CCS has introduced the draft amendments to UR Z13 'Voyage Repairs and Maintenance' at the 10th Survey Panel meeting (16 - 17 September 2009), and based on the drafts the panel members discussed about proper texts to insert in the existing UR Z13.

.4 Other Resolutions Changes

None

.5 Any dissenting views

None

.6 Dates:

Original Proposal: *September 2009, made by Hull Panel*
Panel Approval: *January 2009, made by Survey Panel*
GPG Approval: *11 February 2010 (Ref. 10003_IGd)*

• Rev. 1 (1995)

No TB document available.

• New (1995)

No TB document available.

Part B. Technical Background

List of Technical Background (TB) documents for UR Z13:

Annex 1. **TB for Rev.2 (Feb 2010)**

See separate TB document in Annex 1.

◄▲►

Annex 2. **TB for Rev.3 (Jan 2011)**

See separate TB document in Annex 2.

◄▲►

Note:

1) There are no separate Technical Background (TB) documents for UR Z13 New (1995) and Rev.1 (1995).

Technical Background for UR Z13 Rev.2, Feb 2010

1. Scope and objectives

To amend UR Z13 (Rev.1) for the harmonization with the requirements of the MSC/Circ. 1070 which supersedes MSC/Circ. 807.

2. Engineering background for technical basis and rationale

Remove technical discrepancies between the referenced IACS documents and IMO documents.

3. Source / derivation of the proposed IACS Resolution

- MSC/Circ.1070
- IACS UR Z13 (Rev.1)

4. Summary of Changes intended for the revised Resolution:

1) In case of extreme emergency circumstance, emergency repairs are always to be effected immediately, and the repairs should be verified by the classification society in near future.

2) Review of the application of repair coating is to be carried out as appropriate, as part of the survey of voyage repairs.

3) Riding repairs to primary hull structures is prohibited except in extreme circumstances.

5. Points of discussions or possible discussions

Compare IACS UR Z13 with MSC/Circ. 1070 and develop the wording to be inserted into UR Z13 for harmonizing two documents.

Technical Background for UR Z13 Rev.3, Jan 2011

1. Scope and objectives

To amend Z13 by removal of the word 'extreme' from the phrase 'extreme emergency circumstance' and thereby further align Z13 to MSC/Circ. 1070.

2. Engineering background for technical basis and rationale

Further remove technical discrepancy between referenced IACS documents and IMO documents. It was further agreed that to define an 'extreme emergency circumstance', as opposed to any other emergency circumstance, would be problematic.

3. Source/derivation of the proposed IACS Resolution

- MSC/Circ.1070
- IACS UR Z13 (Rev.2)

4. Summary of Changes intended for the revised Resolution:

To remove the word 'extreme' from the phrase 'extreme emergency circumstance' in Para 2 of UR Z13.

5. Points of discussions or possible discussions

A member raised the issue of defining an 'extreme emergency circumstance', a phrase that had been introduced in Rev.2 of Z13. Various attempts were made to define this. Z13 Rev.2 had been introduced to harmonise requirements with MSC/Circ.1070, though it was noted that this source document made no mention of extreme emergencies, referring only to 'emergency repairs'.

Consequently it was decided that rather than define an extreme emergency, the word 'extreme' should be removed from Para 2 of UR Z13.

6. Attachments if any

None

UR Z15 "Hull, Structure, Equipment and Machinery Surveys of Mobile Offshore Units"

Summary

This revision is to allow application of this UR also to "other similar units" in a similar manner to UR D1, D1.1.2.

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Rev.4 (Jan 2025)	06 January 2025	1 July 2026
Rev.3 (May 2018)	30 May 2019	1 July 2020
Rev.2 (June 2018)	05 June 2018	1 July 2019
Corr.1 (Oct 2016)	10 October 2016	-
Rev.1 (Jan 2015)	12 January 2015	01 January 2016
New (Aug 2002)	30 August 2002	-

- **Rev.4 (Jan 2025)**

1 Origin of Change:

☑ Other (Suggestion by IACS member)

2 Main Reason for Change:

It was agreed that revision of this UR should be made so that "other similar units" may be surveyed in accordance with this UR bearing in mind that such units are mentioned in D1.1.2 of UR D1 "Requirement concerning offshore drilling units and other similar units".

3 Surveyability review of UR and Auditability review of PR

Survey Panel reviewed and agreed to this revision.

4 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

5 History of Decisions Made:

Survey Panel discussed and agreed that requirements for UR Z15 could be applied not only to mobile offshore drilling units but also to other units with some required changes to existing requirements, e.g., deletion of the word "drilling", addition of the term "other similar units".

Due consideration was made to amendments to Section 1.1 "Application", and Survey Panel avoided mentioning specific types of units but agreed to add Para. 1.1.4 "Other Similar Units" to allow application of this UR to such units in a similar manner to Para. D1.1.2 of UR D1.

In addition, the Panel to deletions of Para. 6.2.1 to 6.2.4, where the scope of boiler surveys which was not aligned with that found in UR Z18.2, was specified; and the Panel agreed to state, under Para. 6.2, that boiler surveys are to be carried out according to the scope found in UR Z18.2.

No TB is expected for the present revision.

6 Other Resolutions Changes:

None

7 Any hinderance to MASS, including any other new technologies:

None

8 Dates:

Original Proposal	:	17 July 2024	(Ref. PSU24030_ISUa)
Panel Approval	:	31 October 2024	(Ref. PSU24030_ISUd)
GPG Approval	:	06 January 2024	(Ref: 24209_IGb)

- **Rev. 3 (May 2019)**

.1 Origin of Change:

- Suggestion by an IACS member

.2 Main Reason for Change:

This revision is to address the policy decision made by GPG using the common terminology 'Condition of Class'(CoC) instead of the terms 'Recommendation/ Condition of Class' based on the outcome of III 5.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

During the 29th panel meeting, the panel discussed about the comments of members, and concurred with the view to retain the present definitions of CoC in the IACS resolutions with the wording 'Recommendation' to be removed. The panel also agreed to use the term 'Statutory Condition' for the 'recommendation' of the statutory certificates in IACS resolutions and RECs, and when discussing the proposal of a member to consider the harmonization of the terms of 'recommendation' and 'condition of class' in RO Code, the panel unanimously agreed to take no action on the IMO instruments, leaving the relevant actions to be decided by the relevant IMO bodies when IACS feeds back to IMO the IACS action on the harmonization of the two terms.

Panel members concurred with the view that it is not necessary to develop a new procedure requirement, and agreed to set the implementation date of these IACS resolutions (other than RECs) as 1st July 2020.

Before the implementation date of 1st July 2020 for using the common terminology 'Condition of Class' only, 'Recommendations' and 'Condition of Class' are to be read as being different terms used by Societies for the same thing, i.e. requirements to the effect that specific measures, repairs, surveys etc. are to be carried out within a specific time limit in order to retain Classification.

No TB is expected for the present revision.

.5 Other Resolutions Changes:

The following IACS resolutions and Recommendations (RECs) were agreed to be revised:
- Procedural Requirements: PR1A, PR1B, PR1C, PR1D, PR1 Annex, PR3, PR12, PR20, PR35 and the attachment of PR16;
- Unified Requirements: Z7, Z7.1, Z7.2, Z10.1, Z10.2, Z10.3, Z10.4, Z10.5, Z15 and Z20
- Unified Interpretations: GC13
- Recommendations: Rec.41, Rec.75, Rec.96, Rec.98

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal: 14 January 2019 tasked by GPG (17044bIGm)
Panel Approval: 22 March 2019 (PSU19010)
GPG Approval: 30 May 2019 (17044bIGu)

- **Rev.2 (June 2018)**

.1 Origin of Change:

☑ Suggestion by IACS members

.2 Main Reasons for Change:

To address the FUA 11 of C73, raised by the Council of the IACS in respect to the future work directions on the implications of new technology on survey regime. A revision of UR Z15 is in order to consider the new technologies on Remote Inspections (RIT).

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Members discussed under Panel task PSU 16056 the issue allocated by GPG on 21th October 2016. The subject deals with the review of the UR and Recommendation under Panel responsibility in order to determine whether a revision could need in order to consider the new technologies on Remote Inspections (RIT). The Panel Members concurred to discuss the possible revisions of the UR Z7 in order to address the issue.

New paragraphs 1.2.16 with definition of RIT and & 9.2.3 with means for access, as well as the new section 1.4 "Remote Inspection Techniques (RIT)" were agreed and inserted in the present revision of UR Z15.

No TB is expected for the present revision.

.5 Other Resolutions Changes

UR Z3, UR Z7, UR Z7.1, UR Z7.2, UR Z10.3, UR Z17

.6 Dates:

Original Proposal: 21 October 2016 assigned by GPG
Panel Approval: 15 May 2018 by Survey Panel (Ref: PSU16056)
GPG Approval: 05 June 2018 (Ref: 16151_IGw)

- **Corr.1 (Oct 2016)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reasons for Change:

To correct the title of paragraph 5.2 of the UR Z15 relevant to tailshaft survey

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Following the re-examination of the revision 1 of UR Z15, in order to verify the applicability of the UR Z21 also to MODU, a Member noted that the original title of paragraph 5.2 might be misleading in respect to the contents of the paragraph.

Moreover it has replaced the wording "tailshaft" with "propeller shaft" so that the terminology used in UR Z15 and UR Z21 will be coherent.

Accordingly a rewording of the title has been agreed by the Panel which concurred that this is a merely correction of the UR because nor technical contributions nor substantive modification have been applied to the text

.5 Other Resolutions Changes

Nil

.6 Dates:

Panel Approval: 09 September 2016 (Ref: PSU16031)
GPG Approval: 10 October 2016 (Ref: 16162_IGb)

- **Rev.1 (Jan 2015)**

.1 Origin of Change:

☑ Other: GPG tasked Survey Panel to review UR Z15, identify if it is indeed outdated, make the necessary draft changes (message 12139_IGa C65 FUA 28 – QACE 2011 Annual Report: Review UR Z 15 in light of amendments to UR Z7 (Rev.18))

.2 Main Reasons for Change:

Review UR Z15 and propose changes to update the requirements, in particular, those for close-up inspections and scope and procedures for thickness measurements that need to be aligned with the development of similar requirements for ships (UR Z7).

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Following the GPG request (GPG item 12139) the Survey Panel has been tasked to review the UR Z15 in order to verify if amendments needed to be applied. All Panel Members agreed that the matter should be dealt with by experts in order to prepare the draft modification to the UR Z15. Members concurred that a dedicated PT should be established. Upon GPG agreement the PT no. 22(2013) was set and tasked to:

- develop the revision 1 of UR Z15 (under Survey Panel item PSU12033)

- develop a draft Unified interpretation relevant to the permanent means of aces for MODU (initially under Survey Panel item PSU 12035 and subsequently merged under PSU 12033)

Panel discussed the drafted revision 1 of UR Z15, as prepared by PT, under item PSU12033 and following minor adjustments related to exclusion of the MODU surface units (drilling ships) from the applicability of Z1, Z3, Z6, Z7, Z18 , Z21 and Z22, except when noted in the text, finally Panel agreed the revision 1.

.5 Other Resolutions Changes

Nil

.6 Dates:

Panel Approval: 20 November 2014 (By: Survey Panel)
GPG Approval: 12 January 2015 (Ref: 12139_IGi)

- **NEW (Aug 2002)**

Refer to the TB document in Part B, Annex 1.

Part B. Technical Background

List of Technical Background (TB) documents for UR Z15:

Annex 1. **TB for Original Resolution - NEW (Aug 2002)**

See separate TBs document in Annex 1.

◄▲►

Note: There are no separate Technical Background (TB) documents for Rev.1 (Jan 2015), Corr.1 (Oct 2016), Rev.2 (May 2018), Rev.3 (May 2019) and Rev.4 (Jan 2025).

Technical Background Document
WP/SRC Task 1
UR Z 15 – Proposed

Objective and Scope:

To review existing UR D 12 and relocate it as a UR under UR Z.

Source of Proposed Requirements:

WP/SRC members discussed and reviewed the requirements contained in UR D 12 through correspondence and their meeting. Reservations against UR D 12 were also dealt with at this time as contained in the proposed draft.

Points of Discussion:

WP/SRC unanimously agreed to the proposed draft UR Z 15.

Date of submission: 6 May 1999
By WP/SRC Chairman's e-mail

Technical Background Document

New UR Z 15 and deletion of D12
(Survey after Construction, MODUs)

Objective and Scope:

Re-locate the current MODU survey requirements from UR D12 to a new UR Z.

Source of Proposed Requirements:

WP/SRC Chairman reported in his annual progress report(March 1999, GPG 46) that WP/SRC Members had discussed and reviewed the requirements contained in UR D 12 through correspondence and at their last meeting and had relocated the text of D 12 to a new UR Z15.

The task was carried out as part of Annual review of Implementation of IACS Requirements.

Points of Discussion:

WP/SRC unanimously agreed to the proposed draft UR Z 15.

Council in May 1999 decided that the proposed draft paragraph 2.2.2 should be deleted since it would require Members to periodically check all CSDU's lightship characteristics as a condition of class in the event that it was not checked as a statutory requirement.

Paragraph 2.2.2, which has now been deleted, read as follows:

> 2.2.2 For Column Stabilized Units, a deadweight survey is to be conducted as part of classification surveys at interval not exceeding 5 years or at time of Special Surveys, or as part of statutory surveys at interval specified by the Flag Administrations. Where the deadweight survey indicates a change from the calculated light ship displacement in excess of 1% of the operating displacement, an inclining test is to be conducted.

Note:

Council Chairman announced approval of UR Z15(ex D12) on 15 May 1999 subject to the following conditions:

- Deletion of paragraph 2.2.2;
- Adoption of UR Z18(ex M20) for Z15.5.1 and Z15.6.1;
- Editorial corrections.

UR Z18 was finally approved on 23 November 2001(9056aIAe, 29/01/2002):

- M20 was deleted;
- Z18 "Periodical Survey of Machinery" created excluding tail shaft survey requirements;
- Z21 created for the tail shaft survey requirements.

ABS suggested to re-word Z15.5.1 to avoid the need for filing of reservations on Z15.5.1 simply because it invokes the requirements of Z21. Agreed.

*****

Date of submission: 14 August 2002
By the Permanent Secretariat

UR Z16 "Periodical surveys of cargo installations on ships carrying liquefied gases in bulk"

Summary

This corrigendum is to correct a wrong reference, i.e. reference to Rec.35 in note of Section 4.2 is corrected to Rec.120.

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Corr.1 (May 2022)	09 May 2022	-
Rev.4 (Oct 2013)	11 October 2013	1 July 2014
Corr.1 (Feb 2011)	11 February 2011	1 July 2011
Rev.3 (Mar 2010)	03 March 2010	1 July 2011
Rev.2 (May 2007)	14 May 2007	-
Rev.1 (Mar 2006)	03 March 2006	-
New (June 1999)	28 June 1999	-

- ### Corr.1 (May 2022)

1 Origin of Change:

☑ Based on the proposal of an IACS Member

2 Main Reason for Change:

To correct a reference, Rec.35 to Rec.120 in note of section 4.2.

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

4 History of Decisions Made:

One panel member raised a question on the reference, Rec.35. Panel reviewed and found that Rec.35 was divided into two Recommendations, for tankers (Rec.120) and ships other than tankers (Rec.35), and UR Z16 was not updated accordingly.

No TB is expected for the present corrigendum.

5 Other Resolutions Changes:

None

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal	: 27 May 2021	(Made by Survey Panel Member)
Panel Approval	: 15 April 2022	(Ref: PSU21020)
GPG Approval	: 09 May 2022	(Ref: 22061_IGb)

- **Rev 4 (Oct 2013)**

.1 Origin of Change:

☑ Based on the proposal of an IACS Member

.2 Main Reason for Change:

An IACS member proposed to review IACS UR Z16 section 2.2.8 and to better define "significant differences" with a view to achieving more uniform and consistent application of the requirement by IACS Societies.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

A project team was formed to review SBTT results among members with vessels having a glued secondary barrier. Due to the formation of the project team, the system designer proposed new acceptance criteria which require additional testing once a threshold value is exceeded. The project team reviewed the new criteria and recommended the changes to UR Z16. The changes were approved by the Survey Panel.

.5 Other Resolutions Changes:

The project team also recommended a revision to UI GC12 regarding testing of the SBTT at the time of construction.

.6 Dates:

Panel Approval: 18th Panel Meeting (4-5 September 2013) (Ref: PSU12029)
GPG Approval: 11 October 2013 (Ref: 6179aIGj)

• Corr.1 (Feb 2011)

.1 Origin for Change:

☑ Suggestion by IACS member

.2 Main Reason for Change:

UR Z16 was amended in Mar 2010 in order to clarify NDT requirements for Type C LNG tanks. However the amendment might lead to misunderstanding that it also applies to Type A LNG tanks. In order to eliminate the misunderstanding, the UR amendment is corrected.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

A Survey Panel member pointed out the issue in September 2010, and the subsequent discussion at Survey Panel meeting in September 2010 led to the agreement that the UR should be corrected to avoid the any misunderstanding.

.5 Other Resolutions Changes

None

.6 Dates:

Original Proposal: *September 2010 by a Survey Panel Member*
Panel Approval: *September 2010*
GPG Approval: *11 February 2011 (Ref: 10168_IGf)*

• Rev.3 (Mar 2010)

.1 Origin for Change:

☑ Suggestion by IACS member

.2 Main Reason for Change:

Further to a finding raised during an IACS audit, a clarification was requested within the Survey Panel on paragraph [2.2.6] and paragraph [2.2.3.1] of UR Z16, for Non-Destructive Examination of independent cargo tanks of type C.

.3 History of Decisions Made:

Various discussions were carried out by the panel by correspondence and it was also dealt with in '10th Survey Panel meeting' (held during 13 to 14 September 2009). During discussion, interpretation on "as deemed necessary by the Surveyor" in

[2.2.3.1] was mainly dealt with. And, through correspondence among members after the meeting, a final wording for amendments to UR Z16 was made under agreement of majority of the panel.

.4 Other Resolutions Changes

None

.5 Any dissenting views

None

.6 Dates:

Original Proposal: *24 December 2008 made by Survey Panel*
Survey Panel Approval: *November 2009*
GPG Approval: *3 March 2010 (Ref. 9656_IGd)*

Technical Background Document
WP/SRC Task 1 – Z16

Objective and Scope:

To review the existing UR G4, Periodical surveys of cargo installations on ships carrying liquefied gases in bulk and relocate it as a UR under UR Z.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC members through their experience in the survey of cargo installations on ships carrying liquefied gases in bulk. The existing UR G4 was reviewed and re-organized to follow formats consistent with other UR Z.

Points of Discussion:

WP/SRC unanimously agreed to the draft UR.

Date of submission: 26 May 1999
By WP/SRC Chairman

Technical Background
UR Z16(Rev.1, March 2006), paragraph 4.3

Machinery Panel Task PM5401

The contents of paragraph 4.3, Electrical equipment, of Z16 'Periodical surveys of cargo installations on ships carrying liquefied gases in bulk' was to be reviewed and recommendations to be made for any changes deemed appropriate.

The revised paragraph 4.3 of UR Z16 consolidates proposals made by both the Machinery Panel and the Survey Panel.

The following changes were made:

1. 2nd bullet: delete 'flameproof' as this should apply to all types of enclosures
2. 6th bullet: delete 'and are to be carried out within an acceptable time period' as this expression is considered too vague.
3. Change last bullet to a 'Note'. Rec. 35 is not mandatory but including it in the UR would make it so.

Submitted by Machinery Panel Chairman
17 February 2006

Technical Background

UR Z16 (Rev. 2, 2007)

PSU Task 40: Review issues raised in the Statutory Panel concerning survey requirements for paragraphs 4.10.4 and 4.10.16 and paragraph 1.5.4 for issuance of certificates of the IGC Code regarding the first loaded voyage of ships carrying liquefied gases in bulk.

1. Objective

Review the issues raised in the Statutory Panel NK (SP5034_NKc) regarding the IGC Code verification and inspection following the first loaded voyage to define survey requirements for paragraphs 4.10.4 and 4.10.16 , and amend UR Z16 accordingly.

2. Background

LR Statutory Panel member requested that the Panel should determine if testing requirements should be created for the secondary barriers of LNG carriers.

3. Methodology of Work

The Survey Panel has progressed its work through meetings as well as a Survey Panel Project Team consisting of ABS (Chair), BV, DNV, GL, LR and NK. The proposed scope of work as well as the draft recommendation by the Project Team was circulated to all Members for comment and agreement.

4. Discussion

The first part of the task concerned survey requirements for paragraphs 4.10.4 and 4.10.16 of the IGC Code regarding the first loaded voyage of ships carrying liquefied gases in bulk.

The Project Team reviewed the requirements of the International Code for the Construction and Equipment of Ships Carrying Liquefied Gases in Bulk and discussed current practice among each Society.

The team discussed the survey requirements for the first loading and unloading. The requirements were developed based upon items that the team felt should be surveyed due to the vessel being fully loaded rather than the limited loading at gas trials.

The current practice of testing the secondary membrane was discussed and found only one shipyard was currently testing the secondary barrier after gas trials and most of the others refusing to test after gas trials.

The team also considered the leakage of the secondary barrier by two vessels after delivery which resulted in the vessels being removed from service to be repaired. After investigation, it was felt that the vessel may have developed the leaks on gas trials, though no evidence exists to support this allegation.

It was concluded by the team that the only way to ensure that the secondary barrier was satisfactory when delivered was to require tightness testing of the secondary barrier after gas trials for vessels with glued membranes.

The team also considered the current acceptance criteria by the containment system designer and felt that the criteria had proven to be questionable. Due to the lack of acceptance criteria, the team decided that values obtained before and after initial cooldown shall be evaluated. If significant differences are observed in the before and after results for each tank or between tanks or other anomalies occur, an investigation is to be carried out.

The team then reviewed the requirements of UR Z16 and proposed a revision to incorporate the comparison of previous results and values obtained at Special Survey using the same approach of investigating differences in the before and after results for each tank or between tanks.

The Project Team and all Survey Panel members agreed to the proposed amendments to UR Z16.

(Permsec Note: IACS UI GC12 and GC13 were also developed as a result of this task)

Submitted by the Survey Panel

22 June 2007

Technical Background for UR Z16 Rev.3, March 2010

1. Scope and objectives

To amend UR Z16 (para. 2.2.3.1) to clarify the relevant parts of Non-Destructive Examination of independent cargo tanks of type C

2. Engineering background for technical basis and rationale

Application of paragraph [2.2.6] of UR Z16 at 2nd, 4th, 6th, etc. class renewal survey, and of paragraph [2.2.3.1] at 1st, 3rd, 5th class renewal survey.

3. Source / derivation of the proposed IACS Resolution

Meaning of "....including welded connections as deemed necessary by the Surveyor" in [2.2.3.1].
Addition of the following sentence for the sake of clarity: "However, this does not mean that non-destructive testing can be dispensed with totally."

4. Summary of Changes intended for the revised Resolution:

To prevent "as deemed necessary by the Surveyor" in [2.2.3.1] from being interpreted as 'no Non-Destructive Examination of independent cargo tanks of type C can be done.'

5. Points of discussions or possible discussions

Clarifications on paragraph [2.2.6] and paragraph [2.2.3.1] UR Z16, for Non-Destructive Examination of independent cargo tanks of type C.

6. Attachments if any

None

Technical Background for UR Z16 Rev.4, Oct 2013

1. Scope and objectives

To review IACS UR Z16 section 2.2.8 and to better define “significant differences” with a view to achieving more uniform and consistent application of the requirement by IACS Societies.

2. Engineering background for technical basis and rationale

The system designer issued new acceptance criteria for SBTT testing which is reflected in revised UR Z16.

3. Source / derivation of the proposed IACS Resolution

UR Z16 and GTT External Document No. 1136.

4. Summary of Changes intended for the revised Resolution:

The following amendment is made to UR Z16:

2.2.8

1) For membrane and semi-membrane tanks systems, inspection and testing are to be carried out in accordance with programmes specially prepared in accordance with an approved method for the actual tank system.

2) For membrane containment systems a tightness test of the primary and secondary barrier shall be carried out in accordance with the system designers’ procedures and acceptance criteria as approved by the classification society. Low differential pressure tests may be used for monitoring the cargo containment system performance, but are not considered an acceptable test for the tightness of the secondary barrier.

3) For membrane containment systems with glued secondary barriers, if the designer’s threshold values are exceeded, an investigation is to be carried out and additional testing such as thermographic or acoustic emissions testing should be carried out. ~~the values obtained shall be compared with previous results or results obtained at newbuilding stage. If significant differences are observed for each tank or between tanks, the Surveyor is to require an evaluation and additional testing as necessary.~~

- **Rev.21 (Jan 2025)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

A decision was made to update the requirements for firms engaged in measurements of noise level onboard ships based on MSC.1/Circ.1509/Rev.1.

3 Surveyability review of UR and Auditability review of PR

Survey Panel has agreed to this revision.

4 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

5 History of Decisions Made:

Survey Panel reviewed MSC.1/Circ.1509/Rev.1, which was approved by the IMO MSC 108 in June 2024, whose major change is the introduction of the calibration standards for sound level meter and field calibrators. The Panel has agreed to revise Section 14 (Firms engaged in measurements of Noise level Onboard Ships) in Annex 1 of this UR to reflect the said change.

No TB is expected for the present revision.

6 Other Resolutions Changes:

None

7 Any hinderance to MASS, including any other new technologies:

None

8 Dates:

Original Proposal	:	22 October 2024 (Ref. PSU24046_ISUa)
Panel Approval	:	4 December 2024 (Ref. PSU24046_ISUb)
GPG Approval	:	20 January 2025 (Ref: 24147_IGb)

- **Rev.20 (Nov 2024)**

1 Origin of Change:

☑ Other (Suggestion by IACS QC)

2 Main Reason for Change:

A decision was made that the term related to QSCS was to be amended for clarity.

3 Surveyability review of UR and Auditability review of PR

Survey Panel has agreed to the amendments which were suggested and agreed by Quality Committee.

4 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

5 History of Decisions Made:

The term related to QSCS was clarified that "QSCS certified Society" means such a Classification Society subject to verification of compliance with QSCS in accordance with Section 5 of Annex 1 to the QSCS.

No TB is expected for the present revision.

6 Other Resolutions Changes:

None

7 Any hinderance to MASS, including any other new technologies:

None

8 Dates:

Original Proposal	:	16 September 2024	(Ref. 22032_QCe)
Panel Approval	:	21 October 2024	(Ref. PSU24043_ISUb)
GPG Approval	:	15 November 2024	(Ref: 22032_IGn)

- **Rev.19 (Oct 2024)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

Reference to IACS Recommendation No.180 "Recommendation for conducting commissioning testing of Ballast Water Management Systems" was added in Para. 18.3 and 18.7 of Annex 1 to this UR.

3 Surveyability review of UR and Auditability review of PR

Survey Panel has confirmed acceptance of this revision.

4 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

5 History of Decisions Made:

As IACS has a recommendation relevant to BMWS, reference thereto was added in the relevant section of Annex to this UR.

No TB has been expected for the revision.

6 Other Resolutions Changes:

None

7 Any hinderance to MASS, including any other new technologies:

None

8 Dates:

Original Proposal	: 7 June 2024	(PSU24026_ISUa)
Panel Approval	: 29 August 2024	(Ref: 40th Survey Panel Meeting)
GPG Approval	: 18 Oct 2024	(Ref: 22082_IGg)

• Corr.1 (May 2023)

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

Reference to Resolution MSC.388(94) which amended IMO Resolution A.761(18) in November 2014 was added in Section 5 of Annex 1 to this UR.

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

4 History of Decisions Made:

As reference to Resolution MSC.388(94) was missing, correction was made.

5 Other Resolutions Changes:

None

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal	: 2 March 2023	(PSU23014_ISUa)

Panel Approval	: 15 March 2023	(Ref: 37th Survey Panel Meeting)
GPG Approval	: 17 May 2023	(Ref: 22082_IGe)

- **Rev.18 (Feb 2023)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

To delete the requirement for an ISO/IEC accreditation for service suppliers for BWMS Commissioning Testing.

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

4 History of Decisions Made:

One survey panel member suggested to delete the requirements regarding the ISO/IEC 17025 accreditation to the service suppliers for BWMS Commissioning Testing. ISO/IEC 17025 accreditation is for a specific analysis method and suitable for analyses carried out in accordance with an international standard method in a laboratory. However, for BWMS commissioning testing, the ballast water sampling and subsequent indicative analysis of the samples is carried out on board the ship and does not require any laboratory work. There are currently also no international standard methods for sampling and indicative analysis. As a result, accreditation bodies are currently not offering an ISO/IEC 17025 accreditation specific to sampling and indicative analysis of ballast water on board a ship.

At the 36th Survey Panel meeting, several members raised the urgency of this issue and the panel decided to publish the revision as soon as possible.

No TB has been expected for the revision.

5 Other Resolutions Changes:

None

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal	: 09 June 2022	(Made by Panel Member)
Panel Approval	: 22 September 2022	(Ref: PSU22033_ISUd)
GPG Approval	: 02 February 2023	(Ref: 22182_IGf)

- **Rev.17 (July 2022)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

1) To clarify verification requirements for practical demonstration at initial and renewal audits to allow by documentary review of jobs undertaken since the previous audit and that have been accepted by a QSCS certified Society.

2) To update requirements on inflated rescue boats which are needed to be re-categorised under section 13 from section 5 of Annex 1 due to the introduction of MSC.Rec.404(96).

3) To update references of MSC.1/Circ.1318, MSC.1/Circ.1312, A.Res.1120(30) and MSC.1/Circ.1432 and delete references MSC.Circ.799 and MEPC.Res.279(70)

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

5 History of Decisions Made:

1) One survey panel member suggested to clarify the requirements regarding practical demonstration due to the result of an external audit. This issue had been discussed several times (PSU13025/13030/15027/18009/18047) because of continuous comments during external audits/inspections, especially by EMSA.

   Although UR Z17 did not require 'witnessing' such practical demonstration before certificate is issued, so it could be done by documentary review of jobs undertaken since the previous audit and that have been accepted by a QSCS certified Society, EMSA did not accept it.

   Therefore, survey panel decided to modify the wording to make clear.

2) Survey panel discussed regarding overlapped area between Section 5 and 13 of URZ17 for the servicing inflated rescue boats due to MSC.Res.404(96). MSC.Res.404(96) contains *Requirements for maintenance, thorough examination, operational testing, overhaul and repair means the Requirements for maintenance, thorough examination, operational testing, overhaul and repair of lifeboats and rescue boats, launching appliances and release gear*, adopted by the Maritime Safety Committee of the Organization by resolution MSC.402(96), so survey panel decided to remove rescue boats from UR Z17 Annex 1 section 5 as section 13 could be deemed as covering requirements to use an approved service supplier

3) References of MSC.1/Circ.1318, MSC.1/Circ.1312, A.Res.1120(30) and MSC.1/Circ.1432 were updated, and MSC.Circ.799 and MEPC.Res.279(70) were deleted.

No TB has been expected for the revision.

5 Other Resolutions Changes:

None

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal:

1) 01 December 2021	Made by Panel Member (PSU21056)
2) 27 July 2021	Made by Panel Member (PSU21034)
3) 05 August 2021	Made by Panel Member (PSU21033)
4) 19 September 2021	Made by Panel Member (PSU21041)
5) 19 April 2022	Made by Panel Member (PSU22022)

Panel Approval : 31 May 2022 (PSU21056/21034/21033/21041/22022)
GPG Approval : 04 July 2022 (Ref:22082_IGc)

- **Rev.16 (Aug 2021)**

1 Origin of Change:

☑ Suggestion by IACS member
☑ Based on IMO Regulation (MSC.1/Circ.1222/Rev.1)
☑ Based on IMO Requirement (UR W33)

2 Main Reason for Change:

4) To develop the qualification of the service supplier for BWMS commissioning tests since BWM circular on Guidance for the commissioning testing of ballast water management systems was approved by MEPC75.

5) To strengthen the requirements of UR Z17 para. 5.1 Submission of documents.

6) To update the revised reference of IMO Circular MSC.1/Circ.1222/Rev.1.

7) To be aligned with UR Z23 and UR Z28, "watertight" was added at relevant places regarding cable transits/cable transit systems.

8) To be aligned with the decision for Revision 1 of UR W33, all "NDE" terms were switched to "NDT".

9) To make a term clear to avoid misunderstanding

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

4. History of Decisions Made:

4) BWM circular on Guidance for the commissioning testing of ballast water management systems was approved by MEPC75 for dissemination as BWM.2/Circ.70/Rev.1.

   When reviewing the Guidance, EP members agreed to the benefits of developing a unified approach towards the required qualifications for the service supplier which carry out sampling and sample analysis, and UR Z17 should be updated accordingly.

   It is also noted some Administrations released relevant instruction that the test facility engaged on conducting the commissioning test shall be independent of the manufacturer of the BWMS and accepted by the RO which issues the IBWMC.

   Considering Survey Panel is responsible for maintaining UR Z17, therefore, GPG was suggested by EP to task Survey Panel to consider this issue. After consideration, GPG tasked Survey Panel to consider updating UR Z17 to include the required qualification of the service supplier for BWMS commissioning tests.

   After communication with Environmental Panel, it was agreed that the "qualification requirements of the service supplier for BWMS commissioning test" is to be developed by EP before Survey Panel proceeds to the work of updating UR Z17.

2) One survey panel member proposed strengthening the requirements because it has had some occasions where service supplier technicians have provided falsified reports, so it was agreed to request service supplier one more document regarding the code of conduct.

3) Since IMO Circular MSC.1/Circ.1222 was revised (MSC.1/Circ.1222/Rev.1), it is needed to update the reference.

4) One survey panel member pointed out that UR Z23 and Z28 used terms "watertight cable transits" and "watertight cable transit systems" while Z17 did not. Panel discussed about it and concluded to add "watertight" at proper place in UR Z17.

5) SURVITEC raised a question regarding a term "Authorization" in the para.5.11 because service suppliers do not need to be "authorized" by manufactures in accordance with MSC.402(96), and normally Administration "authorizes" and manufactures "certifies". Survey panel replied that the para.5.11 is a general requirement for all kinds of service suppliers, specific requirements are listed in annexes. However, survey panel agreed that the term may cause misunderstanding and revised to "Certification" to avoid possible misunderstandings.

   No TB has been expected for the revision.

5 Other Resolutions Changes:

None

6 Any hinderance to MASS, including any other new technologies:

GPG Approval: 16 August 2021 (Ref: 20098_IGh)

- **Rev.15 (Oct 2020)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

10) A global unified standard is required to improve the installation and maintenance of Pressure-Rated MCT/Transit systems. In order to properly maintain Ship and Mobile Offshore Unit structures and promote vessel safety during water ingress a better method is necessary to document and manage installation, maintenance, and repair of MCT/Transit systems. By improving documentation during initial installation, incorporating the installation information into a systemized maintenance plan, and using knowledgeable authorized/approved service entities to conduct inspections, the risks of MCT failures will be reduced. This will mitigate potential safety and environmental incidents as a result of service oversights and exposure to onboard flooding conditions.

11) Subcontractors providing the services of the approved service supplier are to be separately approved and certified, but relevant requirements are not clear in the current UR Z17.

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

4 History of Decisions Made:

1) A member of the Survey Panel raised the issue of survey requirements during the 24th Survey Panel Meeting. In detail under discussion is the concept for the preparation of an IACS tool (a Recommendation or an UR, whichever deemed more appropriate) which addresses the complicated and arduous activities associated with the particular inspections required for class to accept the continuous integrity of the multi cable transit from the time of their installation till to the end of the ship's life.

In this respect the Survey Panel discussed the topics and agreed that a PT dealing with the matters would be advisable in order to provide suggestions for the possible revisions of the relevant IACS Resolutions (e.g. Z23, Z7, Z15, and Z17)

PT PSU32/2017 was established, and made revisions to URs Z23, Z7 and Z17.

PT's proposal was submitted to the Survey Panel on 11 August 2017, panel members concurred with comments on PT's submission and proposed actions were taken by the PT. Survey Panel reviewed the drafts which was further amended and agreed by Survey Panel on 14 March 2019 during the 29th Panel Meeting.

Realizing that the UR for approval of Service Suppliers for the inspection of Cable Transits is newly developed by IACS, before enough Service Suppliers being approved, it might be premature to push out the UR for the inspections to the cable transits of ships in service, the members agreed to push out the IACS URs step by step, and firstly to work out the revision to UR Z23 to include the requirement of the "Register" for new construction ships, and the revision to UR Z17 for the details of the approval requirements of the Service Suppliers for the inspection of Cable Transits, and secondly to complete the draft of the new UR Z (other than revising URs Z7 and Z15) in a later time with all the survey requirements to the cable transits, leaving the mandatory requirements for the service supplier to be considered in the future.

After the 30th Survey Panel meeting, the panel finalized the new UR Z28 and the revisions to URs Z23 and Z17.

Refer TB Document in Annex 9 of Part B.

2) A member of Survey Panel initiated the issue of approval of subcontractors providing the services of the approved service supplier which is not clearly stated in UR Z17. Survey Panel discussed and agreed that the subcontractors shall be separately approved and certified, and decided to revise Section 5.2.9 and 5.5.3 to make the requirements clear.

   No TB has been expected for the revision.

5 Other Resolutions Changes:

URs Z23, Z28

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal:
1) W.r.t new requirements - 29 September 2016 Made by a Survey Panel Member
2) W.r.t revision of sections 5.2.9 and 5.5.3 - 11 February 2020 Made by a Survey Panel Member

Panel Approval:
1) W.r.t new requirements - October 2019 (Ref: PSU16049)
2) W.r.t revision of sections 5.2.9 and 5.5.3 - 29 April 2020 (Ref: PSU20011)
3) W.r.t GBS - 21 September 2020 (Ref: 16222_PYg)

GPG Approval: 02 October 2020 (Ref: 16222_IGv)

- **Rev.14 (Mar 2019)**

1 Origin of Change:

☑ Suggestion by IACS Member

2 Main Reason for Change:

Taking into account that the provisions of IMO resolutions MSC.402(96) and MSC. 404(96) will enter into force on 01 January 2020, it is noted that UR Z17 needs to be amended regarding the requirements for service suppliers "Firms engaged in the servicing and maintenance of lifeboats, launching appliances, on-load release gear and davit-launched liferaft automatic release hooks".

3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

Survey Panel concurred with the following:
1) Section 13 of Annex 1 to Z17 is based on the MSC.1/Circ.1277 and MSC.1/ Circ.1206/rev.1
2) Section 13 of Annex 1 to Z17 should be revised for aligning with the requirements of the Annex to MSC.402(96).

Survey Panel members noted that MSC.402(96) was corrected by MSC 96/25/Add.1/Corr.1 on 2017-03-31.

Survey Panel agreed with the following:
- As implementation date of MSC.402(96) is 1 January 2020, the applicability of the amendment to UR Z17 is to be also from 1 January 2020, but the new revisions may be early implemented based on request from service supplier.

- Paragraphs 4.1.1 is to be revised for aligning with MSC.402(96).

- The title of Section 13 of Annex 1 to Z17 is to be amended as follows in line with MSC.402(96):
  "Firms engaged in maintenance, thorough examination, operational testing, overhaul and repair of lifeboats and rescue boats, launching appliances and release gear".

- The references mentioned in Section 13 of Annex 1 are to be changed to MSC.402(96) /Corr.1, i.e. MSC.402(96) as corrected by MSC 96/25/Add.1/Corr.1 in place of MSC.1/ Circ. 1206/ Rev.1 and MSC.1/Circ. 1277.

- Paragraphs 13.1, 13.2.2, 13.3.1, 13.3.2, 13.3.4, 13.3.5 and 13.6 of Section 13 of Annex 1 are to be revised respectively according to paragraphs 2.1, 7.1, 8.1, 8.2.1, 8.2.3, 8.3.1 and 5.3 of the Annex of MSC.402(96).

- Paragraph 13.3.6 of Section 13 of Annex 1 is to be newly inserted according to 8.3.2 of the Annex of MSC.402(96).

- The term "make and type" in Section 13 of Annex 1 is considered to be the same as the term "makes and models" contained in the paragraph 5.1.1 (No.4 item) of the main body of Z17 and paragraphs 5.4 and 9.2.1 of Annex 1 of Z17.

No TB has been expected for the present revision.

5 Other Resolutions Changes:

None

6 Dates:

Original Proposal: 03 May 2017 raised by Survey Panel Member
Panel Approval: 16 January 2019 by Survey Panel (Ref: PSU17019)
GPG Approval: 18 March 2019 (Ref: 18214_IGg)

- **Rev 13 (Jan 2018)**

1 Origin of Change:

☑ Suggestion by IACS Member

2 Main Reason for Change:

To address the FUA 11 of C73, raised by the Council of the IACS in respect to the future work directions on the implications of new technology on survey regime. A revision of UR Z17 is in order to consider the new technologies on Remote Inspections (RIT).

To revise UR Z17 to provide clarity by specifying the applicability of mobile offshore drilling units (MODU). The relevant text in Recommendation 77 and PR19 are also revised to be aligned with the UR Z17.

3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

According to the task assigned by GPG on 21th October 2016 the Panel analysed the issue under PSU16056 by concluding that the UR Z17 needed to be modified in order to:

- Update the annex 1 section 3 by adding the ROV (Remote Operated Vehicles)
- Add a new paragraph to the annex 1 dealing with the certification of the suppliers providing services related to the surveys carried out with RIT (Remote Inspection Techniques)

During the 25th Survey Panel meeting the members agreed the updating of the paragraph 3 of annex 1.
During the 26th Survey Panel meeting, the new paragraph 16 was agreed by the panel.

The proposed amendments by panel member were discussed and agreed under the task PSU17015. The applicability of mobile offshore units had been agreed to be inserted into the content under merged discussion with PSU16056 during the 26th Survey Panel meeting.

No TB as been expected for the present revision.

5 Other Resolutions Changes:

UR Z3, UR Z7, UR Z10.3

6 Dates:

Original Proposal: 21 October 2016 assigned by GPG
05 May 2017 raised Survey Panel Member
Panel Approval: 08 December 2017 by Survey Panel (Ref: PSU16056+PSU17015)
GPG Approval: 16 January 2018 (Ref: 16151_IGq)

- **Rev 12 (Nov 2016)**

1 Origin of Change:

☑ Suggestion by IACS Member

2 Main Reason for Change:

- To provide clarity for the provisions for the certifications of the Supervisors and the Operators of certified service suppliers engaged in thermographic testing of primary and secondary barriers of gas carriers with membrane cargo containment systems.

3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

Panel Members examined the request of clarification related to the different scheme of certification for Supervisors and Operators expected by paragraphs 15.4.3, 15.4.4 and

15.4.6 of the section 15 of the Annex 1 to UR Z17. In particular two issues have been highlighted:

1) The apparent contradiction between the allowed standard SNT-TC-1A, for certification and the sentence *"Certification by the supplier is not allowed and must be obtained through an independent certification body"* contained in paragraphs 15.4.3, 15.4.4 and 15.4.6, since the standard is an industry standard which can be used by the service suppliers to develop their employer-based in-house training and certification managed by the themselves
2) The fact that the paragraphs 15.3.2, 15.3.3 & 15.3.5 have not such limitation (for instance that the certification of the Supervisor and Operators should be obtained through an independent body).

Panel through the help of the PT Manager of PT PSU 23/2014, which developed the draft of the section 15 of Annex 1 to UR Z17, sought the explanation of the limitation that paragraphs C imposes to the use of the standard STN-TC-1A.

PT Manager explained that the limitation was imposed because PT considered the recommendation by the system designer of membrane tanks that the thermographic non-destructive examination was a new procedure of test of the secondary barriers for cargo tank system of the gas carrier and thus the operators and technicians of such tests should not be certified through an employer certification scheme. So PT took precautions and restricted the requirements for thermographic testing just because this was a new procedure

Members concurred with the explanation provided by the PT Manager but at the same time agree the need to eliminate the contradiction present in the texts. The qualified majority of the Panel agreed the modification of the text of paragraphs 15.4.3, 15.4.4 and 15.4.6 by removing the sentence related to the limitation and introducing a new sentence which clarifies the use of the SN-TC-1A certification standard.

No TB as been expected for the present revision.

5 Other Resolutions Changes:

None

6 Dates:

Original Proposal: April 2014   Made by Statutory Panel
Panel Approval: 08 September 2016 by Survey Panel (Ref: PSU16020)
GPG Approval: 28 November 2016 (Ref: 16160_IGe)

- **Rev 11 (June 2015)**

1 Origin of Change:

☑ Suggestion by IACS Members

2 Main Reason for Change:

- To verify the compliance of the UR Z17 with the provisions of the R.O. Code (in particular paragraphs 4.2.4, 5.9 and 5.10).

3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

At the 20Th IACS Survey Panel Meeting, The Chairman of the Panel highlighted to the Members that in all probability this will be a matter of discussion when the UR Z17 will be revised against the R.O. Code. As a consequence of this argument the Chairman recalled that the PT originally in charge of URZ 17 amendments replied to the comment of above GPG Members that the PT was not originally tasked to verify the consistency of UR Z17 towards the requirements of R.O. Code and that it did not perform any action in this sense because the task will require several time in order to be completed.

Members commented that probably a new PT will be necessary in order to comply this duty and that sooner or later the new PT will need to be dealt with, also considering that R.O. Code will enter into force on 1st January 2015. In addition Members argued that the UR Z17 is only one of the matters that should be verified towards the provision of R.O. Code and probably more than a PT will be required if Panel want to consider the same activity for all PRs, URs and UIs that may be interested by the Code.

Some Members expressed it would be better to carry out an Impact Analysis of the R.O. Code whilst other Members were of the opinion that it would be better to have only a PT that deals with all aspect of R.O. code instead of a fragmentation of PTs. All members agreed with the proposal to set up a new PT in order to verify the compliance of the UR Z17 in respect to the R.O. Code.

The Chairman proposed to establish a new PT so that it will be submitted as a proposal to GPG.

At the IACS GPG 77 Meeting, it had been decided to request the Panel to consider a one man PT for this task in order to try to save time and speed up the matter.

PT 25/2014 (one man PT) dealt with the matter of the revision 11 of UR Z17. PT drafted a proposal of modification which was discussed and commented by the Panel by correspondence.

In conjunction Survey Panel examined three substantial comments, made by a GPG Member during the approval of the revision 10, assigned to the Panel by GPG with the recommendation to deal with them in the course of the current revision of the UR Z17. Members concurred with all the comments and the UR Z17 has been modified accordingly.

During the 21st Survey Panel Meeting members finalised the revision 11 of UR 17 which addresses:

-the compliance to the R.O. Code (MSC 349(92))
-the three substantial comments received by the GPG.

See TB document in Part B.

5 Other Resolutions Changes:

None

6 Dates:

Original Proposal: October *2014* *Made by: Statutory Panel*
Panel Approval: 31 March, *2015 by Survey Panel (Ref: PSU14034)*
GPG Approval: 03 June 2015 (Ref: 14184_IGd)

- **Rev 10 (Jan 2015)**

1 Origin of Change:

☑ Suggestion by IACS Members

2 Main Reason for Change:

-To clarify the manufacturer's authorization /approval regarding the service suppliers to perform the services.

-Proposals of Members to revise/add the provisions of UR Z17 in order to comply with the mandatory conventions.

-introduction of a new category of service suppliers that performs acoustic and/or thermographic emissions.

3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

During reply to an external inquiry Statutory Panel identified some changes/additional requirements to UR Z17 and suggested GPG to instruct Survey Panel for considering these amendments to UR Z17.

After reviewing the amendments identified by Statutory Panel, Survey Panel proposed GPG to form a Joint PT with Statutory Panel considering that statutory items are entangled with UR Z17.

GPG agreed to discuss the amendments to UR Z17 by a PT and approved the formation of a joint Survey/Statutory Panel PT under the leadership and budget of Survey Panel.

PT discussed the changes/additional requirements identified by Statutory Panel as well as other additional proposals of IACS Members and finally produced draft revised UR Z17.

Draft revised UR Z17 submitted by PT was further reviewed by both the Survey and Statutory Panels. Survey Panel discussed and revised the draft as appropriate. PT was re involved to review the comments/revisions made by Statutory and Survey Panels. Finally, Survey Panel, in consultation with Statutory Panel, agreed with the latest draft revised UR Z17.
Following the examination by part of GPG some substantial comments raised. The drafted revision 10 of UR Z17 was returned to Survey Panel with all GPG Comments.

Panel and PT dealt with the comments by agreeing modifications to be applied to the draft. Final version of the revised draft, which will include the provisions for the new category of Service Suppliers carrying the global vacuum testing of primary/secondary barriers, acoustic and thermographic emissions test (agreed under Survey Panel task PSU 13040), has been approved by Survey Panel at 20th Meeting (September 2014).

5 Other Resolutions Changes:

Technical Background Document
WP/SRC Task 1-A
UR Z 17 – Proposed Rev. 1

Objective and Scope:

To review existing UR Z 17 to which a reservation has been lodged with a view to eliminating the cause for the reservation and achieving full implementation.

Source of Proposed Requirements:

WP/SRC members discussed and reviewed the reservation lodged against the UR. A proposal based upon the member's experience with service suppliers was agreed to and contained in the proposed draft. An additional item was changed to clarify the use of ultrasonic thickness measuring devices in Annex 1.

Points of Discussion:

WP/SRC unanimously agreed to the proposed draft UR Z 17.

Date of submission: 6 May 1999
By WP/SRC Chairman's e-mail

Technical Background Document
WP/SRC Task 68
UR Z17 – Proposed Draft Revisions 9 (Rev.2 1999)

Objective and Scope:

Revise UR Z17 to meet the requirements of IMO Res A.789(19) for Radio Specialists and other small companies such as diving and gauging.

Source of Proposed Requirements:

The proposed requirements were developed by WP/SRC members through correspondence and their meeting by incorporating the requirements of IMO Res A.789(19) into UR Z17.

Points of Discussion:

1. 4.2.2 was amended to allow external training where internal training was not possible. The members were all in agreement.

2. 4.2.3 was amended to clarify that for a one person company, that person must meet the requirements of a supervisor. The members were all in agreement.

3. Annex I / 6.4 was amended to include the specific requirements of Res A.789(19). The members were all in agreement.

4. A proposal to require an intermediate audit for a one person supplier did not receive the support of the members.

submitted by WP/SRC Chairman
on 12/10/1999

Technical Background Document
UR Z 17 – Rev. 3
(approval of TM Firms and Life-raft servicing stations)

Objective and Scope:

1. To require that new or renewed approval of TM Firms should be valid for the maximum 3 years.

2. To reflect the GPG 52 (March 2002) decision that IACS should seek agreement from the flag Administrations to:

- approve the service stations in accordance with UR Z17;
- accept the service stations approved by the flag Administration itself or other authorized ROs; or
- accept the service stations approved by other SOLAS contracting governments.

Points of Discussion

1. TM Firms

- As a result of the first Quality Management Review at Council 44 (December 2001), Council decided that:
    - the validity of approval certificate of TM Firms should be 3 years maximum. Council instructed GPG to amend relevant URs accordingly
    - IACS should develop a database to record any change in the status of TM Firms and post it to the IACS web page.

– Table VII of Z10.1 (Table V of Z10.2, Table VII of Z10.3) reads that “Renewal or endorsement of the Certificate is to be made at intervals not exceeding 3 years by verification that original conditions are maintained”.

- GPG introduced the same wording to Z17. See section 5.2 of Z17(Rev.3).

2. Liferaft servicing stations

– A member submitted a draft revision to UR Z17 on 19 April 2002 (0126cABb, GPG 52 FUA 61). It is to allow Members to accept statutory service suppliers which had been approved by organizations acceptable to the Flag of the ship with a view to facilitating Members removing their reservations against UR Z17 which were declared when they realized that they were accepting service suppliers approved by the government of the country where the service supplier is located without knowing whether this is acceptable to the Flag Administration. See section 1.2 of Z17(Rev.3).

– Meanwhile, noting that there were still many Administrations who had replied “No” to the question “Accept other governments’ approval”, GPG agreed that IACS submit a paper to IMO MSC 76 with the UK’s sponsorship suggesting that they allow Members to accept such approvals when acting on their behalf. This paper proposed that the same consideration be given to servicing stations servicing inflatable lifejackets, MESs and inflatable rescue boats.

(For actual action taken by GPG, refer to GPG correspondence under 9126c.
This note was added on 31 July 2002)

Date of submission: 13 May 2002
Permanent Secretariat

Technical background UR Z17 Rev.5

Background

A member requested a clarification of the uniform scope of application of requirements for approved TM firms in UR Z17. The member's position was that certification of thickness measurement firms are only required for ESP vessels as there is no mention in UR Z7 requiring this certification.

Furthermore, current revision 3 of Z17 in Annex I state: quote "1.6 Reporting. The report shall be based on the guidelines given in UR Z10.1, Z10.2 or Z10.3, as relevant." unquote. This to the member indicates that when the wording originally was established, ESP vessels only were to comply with this requirement.

WP Discussion

The WP/SRC discussed this issue at two meetings and by correspondence.

1. It appeared that there was little support in the Working Party for the member’s position that UR Z17 only requires approval of TM firms doing thickness measurements of ESP vessels. Several members require a UR Z17 certified TM firm for all hull thickness measurements on all types of ships. The majority of the members agreed with the member that there were practical problems applying the full certification requirements of Z17 to all vessels, in particular for small vessels, in small yards and in remote areas.

2. Member then requested that the Working Party should consider to exclude the certification of TM firms for non-ESP vessels under 90 meters in length from the scope of Z17.

3. However, there was a clear majority in the Working Party for the view that UR Z17 need not apply to non-ESP ships below the SOLAS limit of 500 gross tonnage and also to except all fishing vessels.

WP Conclusion
The conclusion of the discussion in the Working Party is that the wording of UR Z17 is proposed to be changed as follows:

3.1.1 Class services
· Firms engaged in thickness measurements on ships except non-ESP ships less than 500 gross tonnage and all fishing vessels
· Firms engaged in tightness testing of hatches with ultrasonic equipment
· Firms carrying out in-water survey of ships and mobile offshore units
· Firms engaged in the examination of Ro-Ro ships bow, stern, side and inner doors.

and Annex I of Z17 be changed as follows:
1.1 Extent of engagement - Thickness measurement of structural material of ships except non-ESP ships less than 500 gross tonnage and all fishing vessels.
1.6 Reporting. The report shall be based on the guidelines given in UR Z10.1, Z10.2, Z10.3, Z10.4, Z10.5 and UR Z7.1 as relevant.

Furthermore, UR Z7 has to be amended to include a requirement for certification of TM companies for ships of 500 gross tonnage and above except fishing vessels.
12 February 2004 3006hIAb
(similar to para 6.2 and Table IV of UR Z7.1)

GPG discussion
GPG concurred, except that a member reserves on the lower size limit, holding to a limit of 90m length vice 500gt.

Council discussion
Council approved it on 25 February 2004. a member recorded as follows:

”Quote”

Subject: 3006hxxx: WP/SRC-Task 3-UR Z17-TM firms. (Date: 26 Feb 2004)

In reply to ICa, 12 Feb:

1. the revision of UR Z17 circulated with IAb, 12 Feb, is not acceptable to the member.

2. As we have pointed out in the WP/SRC and in GPG, member classes a large fleet of small vessels and we know that:

a. there are very extensive practical problems in getting approved TM firms for the taking of the relatively limited gaugings required on smaller vessels, in small yards, in remote areas and locations; and that

b. small vessels (under 90m L) do not have longitudinal strength issues of large ships--for which very extensive and controlled gaugings are essential--they have local strength issues which can normally be easily identified. Controls of the TM process can, in these cases, be much simpler while still wholly effective.

3. member therefore maintains the reservation declared at GPG against this revision of this UR as stated in the TB attached to IAb. (i.e. member will not require approved TM firms for gauging of non-ESP ships less than 90 m in Length.)

4. Though Chairman has concluded that the revision of the UR has been adopted, we again encourage Members to reconsider their position on this revision of this UR and to agree with member' proposed limits for the use of approved TM firms for structural gaugings.

Regards,

IACS Council Member

****

TECHNICAL BACKGROUND
UR Z17 (Rev.6), June 2007
(Survey Panel Task 1 – Annual Review of Implementation of IACS Resolutions)

1. Objective

To keep IACS Resolutions up to date through annual reviews.

2. Background

To keep IACS Resolutions up to date through annual reviews.

3. Methodology of Work

Survey Panel members through correspondence.

4. Discussion

Survey Panel members were of the opinion that UR Z17 was not in line with current practice of members' methods of acceptance of technicians as external specialists, through the audit of only the headquarters of a company that had in place an accepted quality system that the company and its field offices followed.

Members agreed that relevant sections of UR Z17 needed to be amended to account for quality systems in place for companies that are accepted as external specialists.

Members also agreed that references to applicable quality standards (ISO 9000 series) needed to be updated to reference current standards, throughout the UR.

5. Implementation

The Survey Panel is of the view that the Members need 6 months from the adoption date to implement these amendments into their Procedures. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2008 as an implementation date.

Submitted by Survey Panel Chairman
22 May 2007

Permanent Secretariat note (June 2007):
Amendments to UR Z17, with implementation date of 1 January 2008, adopted 14 June 2007 (7576_IGe).

Technical Background for UR Z17 Rev.9, June 2012

1. Scope and objectives
To provide the same guidelines provided for MSC.215 (82) given in section 13 of annex 1 to UR Z17 for MSC.288 (87).

2. Engineering background for technical basis and rationale
Owing to the difference of testing environment between MSC.215 (82) (coating systems for ballast water tanks) and MSC.288 (87) (coating systems for cargo oil tanks of crude oil tanker), another set of test laboratory approval procedure is required.

3. Source/derivation of the proposed IACS Resolution
None

4. Summary of Changes intended for the revised Resolution
Revised to meet the requirements of MSC.288 (87)

5. Points of discussions or possible discussions
1. In general, the EG/Coating agreed that there is a need to develop a new procedure for the approval of testing laboratories against MSC.288 (87).

2. The EG/Coating agreed, rather than revising existing section 13 of UR Z17, create a new section on PSPC-COT testing laboratories so that the laboratory can choose whether they will conduct testing only for MSC.215 (82), or MSC 288 (87) or both.

3. The EG/Coating developed the draft text of the new section 14 of UR Z17. However, noting that the requirements has not been coming into force yet, and noting the precedence of the IACS Recommendation on Expert Parties Engaged in Visual and/or Sampling Checks for Preparation of Inventory of Hazardous Materials, the Group developed a draft text of new recommendation with a view to incorporating this recommendation into UR Z17 at a future occasion.

4. After this matter was passed onto Statutory Panel, GPG instructed the Statutory Panel to develop a draft revision of UR Z17 using the draft Recommendation developed by EG/Coating as a basis.

6. Attachments if any
None

Technical Background for UR Z17 Rev.10 (Jan 2015)

1. Scope and objectives

-To consider the revision of UR Z17 in order to clarify the manufacturer's authorization /approval regarding the service supplier to perform the service
-To identify any other revisions required for UR Z17 by evaluating the proposals of Members

2. Engineering background for technical basis and rationale

Manufacturer's approval regarding the service supplier to perform the service was considered. Approval and utilization of service suppliers for classification and statutory services were discussed and clarified. Accordingly, approved service suppliers were categorized which are not mandatorily required unless otherwise instructed by the flag administration (with respect to the scope of statutory certification).

3. Source / derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

- New section 'definitions' was introduced to clarify the terms related to the approval of Service suppliers.
- Requirements for manufacturer's approval regarding the service supplier were included.
- Requirements regarding the utilization of service suppliers for classification and/or statutory services were clarified.
- Procedures for firms engaged in servicing and maintenance of lifeboats, launching appliances and firms engaged in measurements of noise levels were newly introduced.
- Approval procedures for firms listed in Annex 1 were amended/updated in order to comply with the mandatory conventions.
- The requirements for the new category of service suppliers, carrying global vacuum testing of primary/secondary barriers, acoustic and thermographic emissions tests, has been introduced. This new category is related to Statutory and Class services, and concerns the tightness test of the membranes of the cargo vessels (of the gas carriers). Requirements have been drafted by a dedicated project team (PSU 23/2014) under the Survey Panel Task PSU 13040. The final attachment to the UR Z17, containing the requirements, has been agreed by the Panel at 20th Meeting (September 2014).

5. Points of discussions or possible discussions

1. PT discussed the changes/additional requirements identified by Statutory Panel members as well as other proposals of IACS members and produced draft revised UR Z17.

2. Survey Panel reviewed the proposed amendments submitted by PT. Survey Panel rearranged the main part of the UR Z17 regarding the services of the approved service suppliers to be required mandatorily or not.

3. Statutory Panel reviewed the draft revised UR U17 which was further amended and agreed by Survey Panel. Comments made by Statutory Panel were further reviewed by PT.

4. GPG reviewed the draft and made substantial comments which were further re-examined by the Survey Panel and by the PT. Comments led to perform small modification in to the drafted text.

6. Attachments if any

Nil

Technical Background for UR Z17 (Rev.11, June 2015)

1. Scope and objectives

- To verify the compliance of the UR Z17 with the provisions of the R.O. Code (in particular paragraphs 4.2.4, 5.9 and 5.10).
- The objectives of this PT are related to the alignment of the UR Z17 Revision 10 with the provisions of the R.O code

2. Engineering background for technical basis and rationale

The PT has performed a gap analysis between the RO code i.e. MSC.349(92) and MEPC.237(65) and the latest version of UR Z17, as developed by the Survey Panel under PSU10039 and referred to as Rev 11.

3. Source/derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

1. It was decided that it was not necessary to implement the paragraph 4.2.4 of the RO code into the UR which concerns the subcontracting of radio surveys to non-exclusive surveyors.

2. Existing paragraph 3 of the UR, where the definition of the Service Supplier has been aligned with the part 2 para. 5.9.2 of the RO code. In fact the provided services carried out address either a ship or a mobile offshore drilling unit.

3. With reference to part 2 para. 5.9.1 of the RO code, a new paragraph 4.13 has been added into the UR. it encompasses the services provided by a third party except the references to outsourcing or subcontracting which are not the aim of the UR Z17.

4. Existing paragraphs 4.2 and 4.3 of the UR, where the results provided by the service suppliers are used by the Society in making decision affecting class and statutory certification. The two above paragraphs have been aligned with the part 2 para. 5.9.2 of the RO code.

5. Existing paragraph 5.2.5 of the UR has been aligned with the part 2 para. 5.10.4 of the RO code. This amendment takes account cases where equipment has been shown to be defective or outside specified limits and/or requirements, the Society shall examine the effect of the defect on previous tests. The Society shall verify any possible biased measurement that could have been performed with defective equipment and therefore, the relevant records are to be kept available on board.

6. With reference to part 2 para. 5.10.5 of the RO code, a new paragraph 5.2.6 has been inserted into the UR, It covers the control of data in monitoring and measuring equipment, in particular when computers are used for the acquisition,

processing, recording, reporting, storage, measurement assessment and monitoring of data, the computer software developed by the supplier shall be suitably validated as being adequate for use. Commercial software, as provided by equipment suppliers, may be considered as sufficiently validated if used within their application range.

7. The requirements have been drafted by a dedicated project team (PSU 25/2014) under the Survey Panel Task PSU 14034. The final attachment to the UR Z17, containing the new requirements, has been agreed by the Panel at 21st Meeting (March 2015).

8. In addition to the above the following three substantial comments to revision 10, received by the GPG, have been examined by the Panel:

   - UR Z17 should not refer to the service supplier's actions as a "survey" ; this should be checked throughout the document. Perhaps we should to identify their actions as inspections and the classification society's overview as the survey.
   - the last sentence of the fourth bullet of 5.1.1 gives no guidance: "Possible terms of termination of such authorization are to be considered in connection with the renewal of the service supplier's certificate." Does IACS even need the last sentence of that bullet given that the first sentence of 6.2 states "Renewal or endorsement of the Certificate is to be made at intervals not exceeding five (5) years by verification through audits that approved conditions are maintained or, where applicable, on expiry of the supplier's approval received from an equipment Manufacturer, whichever comes first?
   - With respect to 5.2.8, why are subcontractors providing subcontracted personnel excepted from the obligations of 5.2 and 5.5, and training in particular? According to the definitions the subcontractor is to assume the obligations of the service provider. If the assumption is that the primary service provider will fulfill all the general requirements of 5.2, and in particular supply the training to the subcontracted personnel this should be stated.

   Panel concurred with the suggested modifications which have been applied to the revision 11

5. Points of discussions or possible discussions

1. PT discussed the results of the gap analysis between the RO code and the Rev 10 of UR Z17 Statutory Panel members and produced draft revised of UR Z17.

2. Survey Panel reviewed the proposed amendments submitted by PT. Survey Panel rearranged the main part of the UR Z17 regarding the wording of certain new requirements

6. Attachments if any

Nil

Technical Background (TB) document for UR Z17 (Rev.15 Oct 2020) and UR Z23 (Rev.7 Oct 2020) and UR Z28 (New Oct 2020)

1. Scope and objectives

For addressing the complicated and arduous activities associated with the class inspections required for assuring the integrity of the pressure rated multi-cable transit (MCT) systems installed onboard ships or mobile offshore units (MOUs) from the time of their construction till the end of the ship's life, IACS took the decision:

- to develop new unified requirements on the survey of MCT systems, to be included in URs Z23, Z7 and Z15, based on the use of approved service suppliers to conduct the inspections of MCT systems; and consequently,

- to develop the relevant criteria for the certification of these service suppliers, to be included in UR Z17.

2. Engineering background for technical basis and rationale

IACS Survey Panel, based on the information provided by various MCT system OEMs to the specific Project Team (PT) established for this task, identified the following items to be considered for drafting the survey requirements:

A. conduct regular inspections to assure good condition of MCT systems, identify possible problems and address repairs in a timely manner;

B. assure the traceability and product document for MCT systems through their lifecycle;

C. apply easy to use technologies (digitization, RFID etc.) to store MCT system condition information;

D. utilize external specialists to perform inspections and to supplement Surveyor’s efforts;

E. analyze repair-data to identify trouble-prone components or systems for proactive attention;

F. standardize inspection and test methods in accordance with OEM recommendations.

IACS Survey Panel acknowledged the following added values in the use of external specialists for the inspection of MCT system and in the adoption of a MCT system register:

A. a means to uniformly carry out the inspection of MCT system across all the class societies;

B. an expert focus on an acknowledged weak-point of bulkhead integrity through the life cycle of a vessel or marine asset;

C. a system by which MCT systems installation can be tracked throughout their life cycle.

3. Source / derivation of the proposed IACS Resolution

A. Industry feedback originating from known casualties and repetitive incidents of poorly installed and maintained equipment.

B. OEM best practices and standards for installation and maintenance.

C. OEM methodologies for documenting and tracking changes, disruptions, repairs or maintenance of MCT system installations.

4. Summary of Changes intended for the revised Resolution:

Changes to Z23 will include new requirements which mandate the adoption of a Multi Cable Transit Seal Systems Register.

The Register, in hard copy or digitized media, will require any MCT system installation to be documented at time of ship's construction. The Register will include a marking / identification system, documentation referencing manufacturer manual(s) for each type of cable transit installed, the Type Approval certification for each type of transit system, applicable installation drawings, and a recording of each installed transit documenting the as built condition after final shipbuilder inspection in the shipyard.

The Register will also include sections to record any inspection, modification, repair and maintenance.

A recommendatory sample Cable Transit Seal System Register will be included in UR Z23 as an attachment.

A new item 8.6 is to be newly inserted into the Table 1 of UR Z23.

Subsequently, a new URZ will be developed in order that the Register will serve as an on board document maintained to track inspections, modifications and repairs and ensure such activities are properly performed by qualified personnel. The Register will also provide the Class Society Surveyor with a tool to improve the effectiveness of periodic inspections on marine vessels at the time of annual and special surveys.

In view of the above, UR Z17 will be revised to include the requirements for the approval of a new category of service suppliers for the inspection of Cable Transit Seal Systems, who will be tasked to verify MCT systems installation. This will assist to promote adherence to proper installation and maintenance procedures.

A new section 17 will be inserted in UR Z17.

5. Points of discussions or possible discussions

5.1 Survey Panel concurred with the view that the fire rated MCT systems and the pipe penetrations should not be considered under this topic, since this task was specifically dealing with Watertight Cable Transits as proposed by the member initiating this issue.

5.2 Survey Panel and PT agreed to define in the Ship Construction File of UR Z23 a document 'Cable Transit Seal System Register' to record the details of watertight cable transits of a ship installed while under construction and throughout its life, including sections to record any inspection, modification, repair and maintenance.

5.3 Survey Panel concurred with the view that criteria should be established to support electronic formatting of the 'Cable Transit Seal System Register', which is the most operationally effective path to assist owners with installation, inspection, maintenance, and repairs throughout the MCT lifecycle, and agreed to include the recommendatory sample of the Cable Transit Seal Systems Register prepared by PT as Appendix 3 of UR Z23.

5.4 Survey Panel agreed to insert a new hull inspection item 8.6 for Watertight Cable Transit Seal System into Table 1 of UR Z23. When discussing whether to enter in the 'Survey Requirements for Classification' with "tightness", some members were of the view that after installation a leak test may be carried out but it is hard to check the actual watertightness of the CTSS, while the other members preferred to testing the watertightness of the CTSS after installation, and finally the panel agreed to leave the requirements of testing of the watertightness of CTSS to be decided by each society individually.

5.5 Survey Panel and PT deemed it necessary to use approved service suppliers to conduct inspections to the MCT/Transit systems, and developed the Section 17 of UR Z17 for the approval of the service suppliers engaged only in the inspections of Cable Transit Seal Systems, with a view that it will be impractical to use an approved service supplier every time for installing or maintaining the Multi Cable Seal Systems, such as when renewing a single cable.

5.6 Provisions for authorization were included in paragraph 17.2.3 of UR Z17 to allow for cases where the transit system OEM is no longer in business or does not provide technical support.

5.7 In paragraph 17.2.1 of UR Z17, it was agreed to include the contents to approve manufacturers or shipyards equally when they are acting as Service Suppliers.

5.8 Other than revising UR Z7 and UR Z15 for the survey requirements of CTSS for ships in service, Survey Panel agreed to develop a new UR Z28 applicable to all vessels and Mobile Offshore Units (MOUs) contracted for construction on or after 1st July 2021, in addition to the requirements of URs Z23, Z7 and Z15.

5.9 Survey Panel agreed to insert item 1.3 to UR Z28, and apply the survey requirement of item 8.6, Table 1 of UR Z23 to MOUs.

5.10 For the paragraph 4.1.3 of UR Z28, one Survey Panel member was of the view that the approved service supplier should also be permitted to undertake inspection of any disruption to the cable transits or installation of new cable transits, otherwise the use of having an approved service supplier is significantly reduced, while the other members supported to confirm those situations by the attending surveyor, and thus the wording "by the attending surveyor" is retained.

UR Z18 "Survey of Machinery"

Summary

This revision to UR Z18 is to include the annual and special survey requirements of the towing winch emergency release systems subject to IACS UR M79.

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Rev.9 (Apr 2020)	09 April 2020	1 July 2021
Rev.8 (July 2018)	16 July 2018	1 July 2019
Rev.7 (June 2017)	29 June 2017	1 July 2018
Rev.6 (Aug 2016)	9 August 2016	1 July 2017
Rev.5 (Apr 2015)	07 April 2015	1 July 2016
Rev.4 (Sep 2014)	17 September 2014	1 July 2015
Rev.3 (Apr 2013)	30 Apr 2013	1 January 2014
Rev.2 (Oct 2006)	29 Oct 2006	1 January 2008
Rev.1 (Jan 2006)	31 Jan 2006	1 January 2007
New (Nov 2001)	23 Nov 2001	-

- **Rev. 9 (Apr 2020)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reason for Change:

As a reaction on the MAIB Report No. 17/2008, IACS Machinery Panel drafted a new UR M79 "Towing Winch Emergency Release Systems" and then inquired Survey Panel about the survey requirements of such systems, and then Survey Panel agreed to develop relevant survey requirements of such systems.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Machinery Panel suggested to separate the part relevant to survey requirements from the newly drafted UR M79 and include them into UR Z18 (Periodical Survey of Machinery) as a new section.

Survey Panel discussed this matter under Task PSU16030, and agreed with the proposal of Machinery Panel to include the annual and special survey requirements of towing winch emergency release systems into UR Z18 as a new paragraph 5, with the following discussions:

- The purpose of the newly developed paragraph 5 is only for the vessels subject to UR M79.

- The panel concurred with the view that the requirement for strong points to be used for testing of winch emergency release system is also the part of information "documented method for annual survey", and agreed not to include this requirement in paragraph 5.1.1.

- In view of that the performance requirements of Section 3.1 of UR M79 are not deemed to be always and actually feasible to verify at the time of the annual survey, more feasible provisions are entered into annual survey items 5.1.2 and 5.1.3 for verifying the compliance of the emergency source with the requirements set by UR M79 para 3.1.5 and 3.1.7;

- Realizing that UR M79 – para. 3.1.3 defines a maximum time delay for emergency release system, but not its documentation at operating positions, Panel members agreed to use the wording in para. 5.1.5 similar to UR M79 – para. 4.1.3.

When consider the survey requirements of annual survey according to UR M79, Survey Panel noted that:

1) At the time of the annual surveys, it is to be ascertained that the documentation required by para 3.2.10 is available on board, and the survey of the winch emergency release system is to be carried out in accordance with such a documentation; and

2) In the new M79 there are no indication/requirements about the responsibilities for the preparation and the review/acceptance (or approval) of the procedure required by 3.2.10.

Survey Panel concurred with the view that these issues should be clarified by Machinery Panel before the draft revision to UR Z18 being finalized, and then raised these issues to Machinery Panel, with the following recommendations: 1) para 3.2.10 of UR M79 may be considered to be absorbed into para 4.1.3, 2) para 3.2.11 of UR M79 may be moved into section 4 and the wording is to be updated to include 'Special Survey'.

Machinery Panel after a long-term consideration, further revised UR M79 and submitted Revision 1 of UR M79 to GPG under task No. PM19919.

Survey Panel then finalized the draft revision to UR Z18 based on the TB and the text of Revision 1 of UR M79.

The implementation date of this revision was agreed to be set as 1st July 2021.

No TB is expected for the present revision.

.5 Other Resolutions Changes:

None

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal:	November 2016 Made by Machinery Panel (Ref: PM11909_PMb)
Panel Approval:	17 December 2019 (Ref: 19235_PYa)
GPG Approval:	09 April 2020 (Ref: 19235_IGj)

- ## Rev.8 (July 2018)

1 Origin of Change:

☑ Suggestion by IACS members

2 Main Reason for Change:

To address the FUA 11 of C73, raised by the Council of the IACS in respect to the future work directions on the implications of new technology on Remote Monitoring/Diagnosis (RMD) and Condition Based Inspecting/Maintenance (CBM). Survey Panel discussed the issue and agreed to establish a PT to provide suggestions for the possible revisions of the relevant IACS Resolutions and Recommendations (e.g. UR Z18, UR Z20, Rec.74) and the draft of new Recommendations/Guidelines which may help the concrete application of these technologies.

3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

Survey panel discussed this issue under Panel task PSU16057 allocated by GPG on 21th October 2016. The subject deals with the review of the UR and Recommendation under Panel responsibility in order to determine whether a revision could need in order to consider the new technologies on Remote Monitoring/Diagnosis (RMD) and Condition Based Inspecting/Maintenance (CBM).

In this respect the Survey Panel discussed the topics and agreed that a PT dealing with the matters would be advisable in order to provide suggestions for the possible revisions of the relevant IACS Resolutions and Recommendations (e.g. UR Z18, UR Z20, Rec 74) and the draft of new Recommendations/Guidelines which may help the concrete application of these technologies.

PT PSU34/2017 was established, and made revisions mostly addressing the following:

- Insert new paragraph ”1.5 Planned Maintenance Scheme”.
- Insert new paragraph ”1.6 Condition Monitoring / Condition Based Maintenance”.

During the 26th Survey Panel meeting, panel members concurred with comments on PT’s submission and proposed actions were taken by the PT. Survey Panel reviewed the drafts which was further amended and agreed by Survey Panel.

Refer to TB Document in Annex 4.

5 Other Resolutions Changes:

UR Z20, UR Z27

6 Dates:

Original Proposal: 21 October 2016 assigned by GPG
Panel Approval: 28 June 2018 by Survey Panel (Ref: PSU16057)
GPG Approval: 16 July 2018 (Ref: 16151_IGz)

- **Rev.7 (June 2017)**

.1 Origin of Change:

☑ Based on the proposal of an IACS Member

.2 Main Reason for Change:

Provision of survey requirements for on-board test of propulsion systems and their controls, discussed under task No. PSU16052.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

As reaction on MAIB Report no. 09/2012 and 31/2014 Machinery Panel drafted UR M25 Rev.4 “Astern power for main propulsion” and sought advice of Survey Panel on the related survey requirements.

Survey Panel discussion was carried out under PSU16052. Panel members agreed that there is no need to issue a new UR and the UR Z18 will be modified accordingly in order to accommodate the issues proposed by the Machinery Panel, and developed a newly added paragraph 4.2 to UR Z18 which aims to the provision of survey requirements for on-board test of propulsion systems and their controls;

Survey Panel also agreed to amend the title of UR Z18 from “Periodical Survey of Machinery” to “Survey of Machinery”, and to move the “Note” in the end of the URZ to paragraph 1 as “1.4 Surveys of Commercial Vessels Supporting Military Use”.

For Rev.7 no TB is provided.

.5 Other Resolutions Changes:

None

.6 Dates:

Original Proposal: October 2016 Made by Machinery Panel (PM12601_PMa)
Panel Approval: 15 June 2017 (Ref: PSU16052)
GPG Approval: 29 June 2017 (Ref: 12095_IGk)

• Rev.6 (Aug 2016)

.1 Origin of Change:

☑ Based on the proposal of an IACS Member

.2 Main Reason for Change:

A Panel Member proposed the discussion about the surveys of boilers that may have not sufficient spaces to grant the surveyor accessibility, such as some smoke type boilers of cylindrical construction, or that may present components of limited dimensions (e.g. some water drums in certain watertube boilers or coil type steam generators/boilers with no direct access to the coil internal surfaces).

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Survey Panel discussed this issue during the 23rd Survey Panel by concurring that a modification of the paragraph 2.1 of the UR Z18 needed. Further the Panel Secretariat prepared a first draft of the intended modification and the discussion take place also considering the possibility of include the remote inspection technology as explained in to the IACS recommendation 42. The initial proposal was supplemented by other suggested by some Members. In addition, the meaning of "limited size of the internal spaces" for boiler without adequate space for inspection was discussed and it was agreed that establishing a common standard for all such boilers would be difficult because of differences in the body size of surveyors.

Finally the qualified majority of the Panel Members agreed the draft text of the modification.

A new sentence has been introduced at the end of paragraph 2.1.

No TB is expected for this revision.

.5 Other Resolutions Changes:

None

.6 Dates:

Original Proposal: March 2016 Made by a Member
Panel Approval: 07 June 2016 (Survey Panel task, Ref PSU16014)
GPG Approval: 09 August 2016 (Ref: 16116_IGc)

- ## Rev.5 (Apr 2015)

.1 Origin of Change:

☑ Based on the proposal of an IACS Member

.2 Main Reason for Change:

Following a query made by a Panel Member seeking the advice of the in granting an extension of the Boiler Survey when the due date of the survey coincides with the due date of the Class Renewal Survey for which an extension has been already granted. The query was completed with the proposal of modification of the paragraph 2.1.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Survey Panel discussed this issue under PSU 14046 and the majority of the Members agreed that the paragraph 2.3 of the UR Z18 is sufficient to cover all cases of extension of the boiler survey and that there is not necessity to modify the paragraph 2.1 of UR Z18.
Notwithstanding the concurrent views, Members agreed that the provisions with which an extension of the boiler periodical survey may be granted, set in paragraph 2.3, shall be moved in paragraph 2.1 where are established the periodicity of the surveys. A new sentence has been introduced in paragraph 2.1 and pargarph 2.3 has been modified accordingly.

During the discussion a Member highlighted that the text of the foot note which defines the Exceptional Circumstances (under which the extension may be granted) needed to be clarified because it contained the wording "e.g." before the list. Panel agreed that this wording left undefined and opened to interpretation the list of the exceptional circumstances, therefore Panel concurred to delete it.

Having cancelled the wording of paragraph 2.3 to which the above footnote was referenced, it has been provided to move the footnote under the paragraph 2.1 by referencing it to the new sentence introduced with the modification described above.

No TB is expected for this revision.

.5 Other Resolutions Changes:

None

.6 Dates:

Original Proposal: December 2014 Made by a Member
Panel Approval: 23 February 2015 (Survey Panel)
GPG Approval: 07 April 2015 (Ref: 15028_IGd)

• Rev.4 (Sep 2014)

.1 Origin of Change:

☑ Based on the proposal of an IACS Member

.2 Main Reason for Change:

Consider appropriate text in IACS document regarding class period for lengthy conversions according to the similar changes applied to UR Z 7 series and UR Z10 series.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Survey Panel discussed this issue under PSU 14014 and agreed to modify the UR Z18 similarly to what done at paragraph 2.1.3 of the Rev. 21 of UR Z7, Rev. 10 of UR Z7.1, Rev. 5 of UR Z7.2, Rev. 21 of UR Z10.1, Rev. 31 of UR Z10.2, Rev. 16 of UR Z10.3, Rev. 12 of UR Z10.4 and Rev. 14 of UR Z10.5.

Modification introduces the possibility, for the Owner of a ship carrying an overdue Special/Renewal Survey (e.g. in case of long period of lay-up, or major modification, etc..) to elect if instead of the ascertainment of the expired survey those relevant to the next due Special/Renewal Survey are carried out. This possibility allows that the new period will have 5 years of duration starting from the date of the Special/Renewal Survey completion.

The modification has been applied to paragraph 1.1.3.

.5 Other Resolutions Changes:

None

.6 Dates:

Original Proposal: May 2014 Made by a Member
Panel Approval: June 2014 (Survey Panel)
GPG Approval: 17 September 2014 (Ref: 13064aIGb)

- **Rev.3 (Apr 2013)**

.1 Origin of Change:

☑ Based on the proposal of an IACS Member

.2 Main Reason for Change:

An IACS member proposed to discuss and clarify the provisions of dock trial expressed in paragraph 4.1 of UR. Z18 because auditors asked for the evidence during an audit that in occasion of all dry docks the trials, at least the dock trials, are to be carried out.
This IACS member expressed that the request of dock trial should be not directly related to the fact that the ship was docked. It should be more pertinent to relate dock trial as an operation to be carried out in order to complete a periodical (renewal) or an occasional machinery survey, as appropriate.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

Survey Panel discussed this issue under PSU 12010 and agreed to clarify the provision of dock trial in order to eliminate future audit findings. Panel agreed to amend the text in Para 4.1 of UR Z18 '*At the time of drydocking*' by the text '*As Part of the Special Survey of Machinery*' for better clarity.

.5 Other Resolutions Changes:

None

.6 Dates:

Panel Approval: 16th Survey Panel Meeting 2012 (Ref: PSU12010)

Technical Background Document
WP/SRC Task 1
New UR Z 18, Z21 and deletion of M20
(+ Rev.8 of Z7)

Objective and Scope:

To review existing UR M 20 and relocate it as a UR under UR Z.

Source of Proposed Requirements:

WP/SRC Chairman reported by e-mail 6 May 1999 that WP/SRC Members had discussed and reviewed the requirements contained in UR M20 through correspondence and at their last meeting and had relocated the text of M20 to a new UR Z18. A proposal for resolving ABS' existing reservations against M20 is included in the proposed UR Z18.

Points of Discussion:

WP/SRC unanimously agreed to the proposed draft UR Z 18.

Note by the Permanent Secretariat

GPG did not accept WP/SRC's proposal for resolving ABS' reservations since the proposal would not, in fact, lead to any greater uniformity in practice than by simply retaining ABS' existing reservations, and therefore did not approve the proposed UR Z18, pending receipt and consideration of an acceptable means of resolving ABS' reservations from the ABS GPG representative. The ABS GPG representative reported to GPG, at its 51st meeting on 2-4 October 2001 that ABS was not prepared to change its practice and that he could not identify any means of resolving ABS' reservations without significant change to other Members practices, which other Members were not prepared to accept.

Therefore, GPG expressed its preparedness to live with ABS reservation to the tail shaft survey requirements of ex M20 (now Z21), agreed to isolate it from Z18.

Outcome:

- Delete M 20;
- Create new Z18 excluding tail shaft survey requirements;
- Create new Z21 for the tail shaft survey requirements.
- Revision 8 of Z7 to have the same descriptions of special survey as those in Z10s and Z18.

  (GPG considered it prudent to keep Revision 8 of Z7 in abeyance until WP/SRC complete its Task 83 "revision of Z7".)

Date of submission: 6 May 1999
By WP/SRC Chairman's e-mail

Survey Panel Task 5 – Amend Survey Intervals for Boilers
Survey Panel Task 6 – Develop Requirements for Survey of Boiler Pressure Relief Arrangements
Survey Panel Task 7 – Amend Z18 to consider surveys of Exhaust Gas Heated Economizers
*** Note The three Tasks above are all to amend UR Z18**

Technical Background
UR Z18 (Rev.1, Jan 2006)

1. **Objective**

To amend the requirements of UR Z18 to address the survey panel tasks as described above.

2. **Background**

Task 5 & 6 as listed above were tasked by GPG to better align survey Intervals as requested by GPG Member from RINA and by the WP/MCH to expand the requirements for pressure relief arrangements to all boilers respectively.
Task 7 as listed above, was tasked due to a report from the MCA MAIB report on the "Island Princess" casualty.

3. **Methodology of Work**

Survey Panel member from LR proposed amendments to deal with Task 5 and Task 6 at the February 2005 Survey Panel meeting and with that, correspondence has continued until the Fall meeting, as to acceptable amendments (including the inclusion of Task 7 amendments to UR Z18) to come to a final submittal.

4. **Discussion**

With the submission of proposed amendments from LR as noted above the Survey Panel members through correspondence has the following comments which led to the Panel's final submittal:
ABS Panel member made the following comments:
In paragraph 2.1, ABS is of the opinion that IACS should include a provision to allow extensions of boiler surveys in order to align with drydocking surveys or in case of exceptional circumstances.

This can be done by including the wording from one of the two methods noted below:

1. Consideration may be given for extensions Boiler Surveys beyond the due date.

or

2. An extension of examination of the boiler up to 3 months beyond the due date can be granted in exceptional circumstances. (Note if use this option then we need to define exceptional circumstances as per Z3).

NK Panel member comments:

2.1 Last sentence of existing UR Z18.2.1 requires the examination and test only for boiler safety valve relieving gear at each boiler internal survey. NK considers that boiler safety valve body should be included in this requirement.
2.2 Inspection item for safety/protective devices and safety valves at annual survey is not specified in the existing UR Z 18.2.2. NK considers that test requirements for safety/protective devices and safety valves at annual survey should be included in UR Z18.2.2.

Some members disagreed with the provisions for allowing extensions to the boiler surveys and with that RINA responded with the following:
As regards DNV's disagreement on the introduction of a provision allowing an extension of boiler surveys, we point out that it does not seem consistent to provide more flexibility to intermediate and special surveys (and to drydocking survey as well) than to boiler survey. And it is just this less flexibility that UR Z18 allows to boiler survey with respect to those above mentioned that we are often faced by cases where boiler survey interval exceeds the "fatal" 36 months. In fact, if a boiler survey is carried out concurrently with the special survey and credited with same date, the next boiler survey will be due after 36 months (without possibility of extension!!!), while the intermediate survey may reach the 39th month.
We are therefore in favor to introducing a provision for an extension to boiler survey up to three months, but without stating "in exceptional circumstances". We prefer to introduce a requirement for a specific "extension survey" which is to be of the same scope of the examination at annual survey.
All members agreed at the Fall Survey Panel meeting that having the provision for an extension of the boiler survey was acceptable.
Regarding Survey Panel Task 7 members discussed through correspondence the extent of weld examinations to be carried out during exhaust gas heated economizer surveys, and the proposal for the extent of NDT to be carried out. At the Fall Survey Panel meeting it was agreed by all Panel members that all accessible welded joints be visually examined and NDT be carried out as necessary.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2007 as an implementation date.

6. GPG consideration

In its consideration for adoption of the amended UR, GPG posed questions to the Survey Panel in 4069jIGx, 30 Nov 05, to which the Survey Panel replied in 4069jPYb, 06 Jan 06, advising that Survey Panel concluded that no further amendments to item 2.4 of UR Z18 are necessary.

***

TECHNICAL BACKGROUND

UR Z3 (Rev. 4), Z 7 (Rev. 14), Z18 (Rev. 2) and Z21 (Rev. 2)

Survey Panel Meeting March 2006 New Business Item – Applying UR Z3, Z7, Z18 and Z21 for Military Vessels.

1. **Objective**

To add the following new paragraph to UR Z3, Z7, Z18 and Z21 to reflect that special consideration may be used for military vessels:
"Special consideration may be given in application of relevant sections of this Unified Requirement to military vessels or commercial vessels owned or chartered by Governments, which are utilized in support of military operations or service".

2. **Background**

This task was originally discussed during the Survey Panel meeting, which took place at ABS Houston on the 1st to 3rd March 2006; it was subsequently recorded under paragraph 3 "new business" of the minutes of this meeting.
This initial started as a proposal for ABS to remove their reservation (see below) for military vessels against UR Z3 and Z7s. However all of the members agreed to the proposal.
Current ABS Reservation: "ABS allows variations in survey interval in agreement with US Government for military vessels or commercial vessels owned or chartered by the Government which are utilized in support of military operations or service."

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel member from ABS raised this issue at the March 2006 Survey Panel meeting and volunteered to propose amendments to the applicable URs for Panel members to review and comment on through correspondence. At the Fall meeting of the Survey Panel, it was agreed upon by all Panel members that the proposed amendments for UR Z3, Z7, Z18 and Z21, which were proposed by ABS, were acceptable.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2008 as an

implementation date.   However due to other on going revisions to UR Z21 this UR will be held abeyance until the other revisions are completed.

6. **Discussion at GPG:** GPG amended the proposal by deleting the phrase “military vessels or” on the basis that military vessels and other government ships operated for non-commercial purposes are out of the scope of IACS URs. The adopted amendment therefore reads:

“Special consideration may be given in application of relevant sections of this Unified Requirement to commercial vessels owned or chartered by Governments, which are utilized in support of military operations or service”.

Submitted by Survey Panel Chair, October 2006
Updated by GPG to reflect their discussion

Technical Background (TB) document for UR Z18 (Rev.8 July 2018)

1. Scope and objectives

Upon the investigations of new technologies' implications on survey regime, IACS developed this unified requirement to the approved Condition Monitoring and Condition Based Maintenance schemes applying to the machinery components and systems where the condition monitoring results are used to influence the scope and/or frequency of Class survey, including the requirements of software, onboard working, documentation, personnel, approval and survey for applying the scheme, and survey/audit for maintenance of the scheme.

2. Engineering background for technical basis and rationale

As far as the PT members have been able to conclude, the CBM is a set of maintenance actions based on real-time or near-real time assessment of equipment condition which is obtained from embedded sensors and/or external tests & measurements taken by portable equipment. From a Classification Society's consideration, the RMD embraces similar principles of monitoring. Apart of CBM and RMD there exist various systems of monitoring based on acquisition and processing of information and data that indicate the state of a machine over time. With emerging technologies such as Radio Frequency IDentification (RFID), various sensors, Micro-Electro-Mechanical System (MEMS), wireless tele-communication, Supervisory Control and Data Acquisition (SCADA) and Product Embedded Information Devices (PEID) there are expected to be rapidly used in the world such systems for gathering and monitoring the status of components. Moreover, the CBM scheme in general can be treated as a method used to reduce the uncertainty of maintenance activities and embraces various condition monitoring/diagnosis technologies and techniques such as lubricant/fuel, wear particle, bearing temperature, infrared thermography and motor current signature analysis.

Having recognized that, the PT agreed the subsequent Guidelines shall not be limited only by CBM and RMD systems and decided to leave opportunity for implementation existing and forthcoming systems based on the principals of the condition monitoring/diagnosing intrinsic to the CBM.

3. Source / derivation of the proposed IACS Resolution

The PT reviewed the current IACS Resolutions and Recommendations and detected paragraphs potentially impacted.

4. Summary of Changes intended for the revised Resolution:

The PT prepared a draft of a new document UR Z27 covering Condition Monitoring and Condition Based Maintenance schemes where the condition monitoring results are used to influence the scope and/or frequency of Class survey. Besides, the PT proposed a draft of corrigenda to the UR Z18, UR Z20 and Recommendation 74.

5. Points of discussions or possible discussions

The task was triggered by GPG to review and set the future work directions on the implications of new technology on survey regime, in relation with other technologies, especially the Remote Monitoring/Diagnosis (RMD) and the Condition Based Inspecting/Maintenance (CBM). A project team was agreed to be established, and the Form A and Form 1 were agreed by GPG on 24/03/2017.

PT manager submitted the PT outcomes to the Survey Panel meeting on 25/08/2017, and some comments were got from panel members before the 26th panel meeting.

During the 26th Survey Panel meeting, a Member introduced their comments and indicated that as a minimum requirement, the related UR shall include the minimum parameters to be checked in order to monitor the condition of the various machinery for which this type of maintenance is accepted; The panel agreed with the view of a Member that for ease of understanding and implementation, revisions should be made in UR Z20 only, to include the elements of the proposed new UR instead of having two separate URs.

The PT suggested:

- that elaborating on requirements would likely to limit UR's applicability for ensuing technologies, thus no changes are required.

- to steer a course of action had been embarked on during the team joint work and be committed to have a separate UR Z27 instead of merging the requirements with UR Z20.

Based on preceding discussion it was concluded that qualified majority of the Panel Members agreed with PT's opinion that a separate UR for CM/CBM as designed by PT was the appropriate course of action.

PT, after examination of the Panel's comments, prepared

- a new version of the draft UR addressing the comments and suggestions, and

- the technical justifications/explanations.

On October 2017 PT sent to the Panel the new version of the draft.

Finally, the qualified majority of the Panel Members agreed the draft text of the UR Z27 and modifications to UR Z18, UR Z20 and Recommendation 74.

None

Technical Background Document
WP/SRC Task 60
UR Z 19 – Proposed

Objective and Scope:

To develop a Unified Requirement with regard to calibration of inspection, measuring and testing equipment used to verify products to be certified or classified by a Member Society or to be used in the re-classification process.

Source of Proposed Requirements:

WP/SRC members discussed this issue through correspondence and their meeting. The requirements were developed through the Member's experience with the calibration of equipment used by the Surveyor.

Points of Discussion:

WP/SRC unanimously agreed to the proposed draft UR Z 19.

Date of submission: 6 May 1999
By WP/SRC Chairman's e-mail

UR Z20 “Planned Maintenance Scheme (PMS) for Machinery”

Summary

This revision is to harmonize the terms of ‘recommendation’ and ‘condition of class’ with only the term ‘condition of class’ being retained.

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Rev.2 (May 2019)	30 May 2019	1 July 2020
Rev.1 (July 2018)	16 July 2018	1 July 2019
New (May 2001)	May 2001	-

- **Rev. 2 (May 2019)**

.1 Origin of Change:

☑ Suggestion by an IACS member

.2 Main Reason for Change:

This revision is to address the policy decision made by GPG using the common terminology ‘Condition of Class’(CoC) instead of the terms ‘Recommendation/ Condition of Class’ based on the outcome of III 5.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

During the 29th panel meeting, the panel discussed about the comments of members, and concurred with the view to retain the present definitions of CoC in the IACS resolutions with the wording ‘Recommendation’ to be removed. The panel also agreed to use the term ‘Statutory Condition’ for the ‘recommendation’ of the statutory certificates in IACS resolutions and RECs, and when discussing the proposal of a member to consider the harmonization of the terms of ‘recommendation’ and ‘condition of class’ in RO Code, the panel unanimously agreed to take no action on the IMO instruments, leaving the relevant actions to be decided by the relevant IMO bodies when IACS feeds back to IMO the IACS action on the harmonization of the two terms.

Panel members concurred with the view that it is not necessary to develop a new procedure requirement, and agreed to set the implementation date of these IACS resolutions (other than RECs) as 1st July 2020.

Before the implementation date of 1st July 2020 for using the common terminology 'Condition of Class' only, 'Recommendations' and 'Condition of Class' are to be read as being different terms used by Societies for the same thing, i.e. requirements to the effect that specific measures, repairs, surveys etc. are to be carried out within a specific time limit in order to retain Classification.

No TB is expected for the present revision.

.5 Other Resolutions Changes:

The following IACS resolutions and Recommendations (RECs) were agreed to be revised:

- Procedural Requirements: PR1A, PR1B, PR1C, PR1D, PR1 Annex, PR3, PR12, PR20, PR35 and the attachment of PR16;
- Unified Requirements: Z7, Z7.1, Z7.2, Z10.1, Z10.2, Z10.3, Z10.4, Z10.5, Z15 and Z20
- Unified Interpretations: GC13
- Recommendations: Rec.41, Rec.75, Rec.96, Rec.98

.6 Any hinderance to MASS, including any other new technologies:

None

.7 Dates:

Original Proposal: 14 January 2019 tasked by GPG (17044bIGm)
Panel Approval: 22 March 2019 (PSU19010)
GPG Approval: 30 May 2019 (17044bIGu)

- **Rev.1 (July 2018)**

1 Origin of Change:

☑ Suggestion by IACS members

2 Main Reason for Change:

To address the FUA 11 of C73, raised by the Council of the IACS in respect to the future work directions on the implications of new technology on Remote Monitoring/Diagnosis (RMD) and Condition Based Inspecting/Maintenance (CBM). Survey Panel discussed the issue and agreed to establish a PT to provide suggestions for the possible revisions of the relevant IACS Resolutions and Recommendations (e.g. UR Z18, UR Z20, Rec.74) and the draft of new Recommendations/Guidelines which may help the concrete application of these technologies.

3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

Survey panel discussed this issue under Panel task PSU16057 allocated by GPG on 21th October 2016. The subject deals with the review of the UR and Recommendation under Panel responsibility in order to determine whether a revision could need in order to consider the new technologies on Remote Monitoring/Diagnosis (RMD) and Condition Based Inspecting/Maintenance (CBM).

In this respect the Survey Panel discussed the topics and agreed that a PT dealing with the matters would be advisable in order to provide suggestions for the possible revisions of the relevant IACS Resolutions and Recommendations (e.g. UR Z18, UR Z20, Rec 74) and the draft of new Recommendations/Guidelines which may help the concrete application of these technologies.

PT PSU34/2017 was established, and made revisions mostly addressing the following:

- Delete paragraph 1.2.2.
- Delete paragraph 2.2.1(vi)(vii), 2.2.2(iii) and renumbered the following items
- Delete paragraph 2.3.3(ii)(iii)
- Delete paragraph 3.2.7 and renumber the following item 3.2.8

During the 26th Survey Panel meeting, panel members concurred with comments on PT's submission and proposed actions were taken by the PT. Survey Panel reviewed the drafts which was further amended and agreed by Survey Panel.

Refer to TB Document in Annex 1.

Part B. Technical Background

List of Technical Background (TB) documents for UR Z20:

Annex 1. **TB for Rev.1 (July 2018)**

See separate TB document in Annex 1.

◄▼►

Note: There are no separate Technical Background (TB) document available for New (May 2001) and Rev.2 (May 2019).

Technical Background (TB) document for UR Z20 (Rev.1 July 2018)

1. Scope and objectives

Upon the investigations of new technologies' implications on survey regime, IACS developed this unified requirement to the approved Condition Monitoring and Condition Based Maintenance schemes applying to the machinery components and systems where the condition monitoring results are used to influence the scope and/or frequency of Class survey, including the requirements of software, onboard working, documentation, personnel, approval and survey for applying the scheme, and survey/audit for maintenance of the scheme.

2. Engineering background for technical basis and rationale

As far as the PT members have been able to conclude, the CBM is a set of maintenance actions based on real-time or near-real time assessment of equipment condition which is obtained from embedded sensors and/or external tests & measurements taken by portable equipment. From a Classification Society's consideration, the RMD embraces similar principles of monitoring. Apart of CBM and RMD there exist various systems of monitoring based on acquisition and processing of information and data that indicate the state of a machine over time. With emerging technologies such as Radio Frequency IDentification (RFID), various sensors, Micro-Electro-Mechanical System (MEMS), wireless tele-communication, Supervisory Control and Data Acquisition (SCADA) and Product Embedded Information Devices (PEID) there are expected to be rapidly used in the world such systems for gathering and monitoring the status of components. Moreover, the CBM scheme in general can be treated as a method used to reduce the uncertainty of maintenance activities and embraces various condition monitoring/diagnosis technologies and techniques such as lubricant/fuel, wear particle, bearing temperature, infrared thermography and motor current signature analysis.

Having recognized that, the PT agreed the subsequent Guidelines shall not be limited only by CBM and RMD systems and decided to leave opportunity for implementation existing and forthcoming systems based on the principals of the condition monitoring/diagnosing intrinsic to the CBM.

3. Source / derivation of the proposed IACS Resolution

The PT reviewed the current IACS Resolutions and Recommendations and detected paragraphs potentially impacted.

4. Summary of Changes intended for the revised Resolution:

The PT prepared a draft of a new document UR Z27 covering Condition Monitoring and Condition Based Maintenance schemes where the condition monitoring results are used to influence the scope and/or frequency of Class survey. Besides, the PT proposed a draft of corrigenda to the UR Z18, UR Z20 and Recommendation 74.

5. Points of discussions or possible discussions

The task was triggered by GPG to review and set the future work directions on the implications of new technology on survey regime, in relation with other technologies, especially the Remote Monitoring/Diagnosis (RMD) and the Condition Based Inspecting/Maintenance (CBM). A project team was agreed to be established, and the Form A and Form 1 were agreed by GPG on 24/03/2017.

PT manager submitted the PT outcomes to the Survey Panel meeting on 25/08/2017, and some comments were got from panel members before the 26th panel meeting.

During the 26th Survey Panel meeting, a Member introduced their comments and indicated that as a minimum requirement, the related UR shall include the minimum parameters to be checked in order to monitor the condition of the various machinery for which this type of maintenance is accepted; The panel agreed with the view of a Member that for ease of understanding and implementation, revisions should be made in UR Z20 only, to include the elements of the proposed new UR instead of having two separate URs.

The PT suggested:

- that elaborating on requirements would likely to limit UR's applicability for ensuing technologies, thus no changes are required.

- to steer a course of action had been embarked on during the team joint work and be committed to have a separate UR Z27 instead of merging the requirements with UR Z20.

Based on preceding discussion it was concluded that qualified majority of the Panel Members agreed with PT's opinion that a separate UR for CM/CBM as designed by PT was the appropriate course of action.

PT, after examination of the Panel's comments, prepared
- a new version of the draft UR addressing the comments and suggestions, and
- the technical justifications/explanations.

On October 2017 PT sent to the Panel the new version of the draft.

Finally, the qualified majority of the Panel Members agreed the draft text of the UR Z27 and modifications to UR Z18, UR Z20 and Recommendation 74.

Rev.4 (Oct 2015)

.1 Origin of Change:

☑ Other *(Suggestion by GPG)*

.2 Main Reason for Change:

The task was triggered following the analysis of the comments to the revision 3 received by GPG.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

During the approval of the revision 3 of UR Z21, GPG provided some comments/hints to the Survey Panel for their consideration and action as appropriate. Panel members during the 21st Survey Panel meeting analyzed the comments with the aim to verify whether a new revision of UR Z21 was necessary.

Panel, having examined the comments, agreed that the UR Z21 needed to be revised in order to apply small modifications which made more clear the text. Moreover a Panel Member raised comments on the wording of the definition of "alternative means" since the definition does not clearly exclude from the application of the UR Z21 the shaft's arrangements which are provided with a monitoring system of the working parameters such as the "Tailshaft Monitoring System".

As outcome of the 21st Survey Panel Meeting most of the comments were addressed and only one, related to the alignment of survey periodicity for propulsion shafts having the propeller coupled with the keyed system to those of shafts having the propeller coupled with keyless system, remained unresolved since a clear qualified majority was not expressed.

The task continued by correspondence with the aim to find possible solutions which might avoid future reservations. For what concerned the comment about the survey periodicity, the Society who raised it provided its technical background in order to explain the reasons behind its request. At the same time Some Panel members proposed new wordings which might resolve the concerns related to the definition of the “Alternative Means”.

After some correspondence rounds the majority of the Panel Members concurred that there is no sufficient technical background to consider the alignment of the survey periodicity: only two members (the proposing Society and another Member) expressed their preference for this modification.

For what concern the rewording of the definition of Alternative Means the majority of the Members finds a common view. Only one Member expressed its dissent view about the proposal since his understanding is that the revision 3 of UR Z21 is applicable also to propulsion shaft arrangements which are provided of monitoring system devices.

At 22nd Survey Panel meeting, the modifications of the UR Z21 have been finalized by issuing the draft of the revision 4.
It is to note that notwithstanding several tentative by part of the Survey Panel members it was not possible to provide a draft which may resolve all the possible concerns that might avoid the issue of reservation.

The outcomes of the analysis of the GPG comments are recorded in the Technical Background associated to this revision.

.5 Other Resolutions Changes:

None

.6 Dates:

Original Proposal: *January 2015* made by GPG
Panel Approval: *16 September 2015* by Survey Panel at 22nd Survey Panel meeting (Ref: PSU15006)
GPG Approval: *9 October 2015* (Ref: 12080_IGo)

Rev 3 (Feb 2015)

.1 Origin of Change:

- ☑ Suggestion by an IACS member
- ☑ Other *(Suggestion by GPG)*

.2 Main Reason for Change:

The task was triggered in 2006 following the reservations, raised by some IACS Members, against the contents of UR Z21 relevant to the periodicity and modality of survey of Propeller Shafts and Tube Shafts.

The expected benefits of the work are focused to achieve the harmonization of the survey criteria between members on a fundamental matter related to the classification (e.g. in view of the TOC), taking also in account new building technologies (e.g. the new kind of water lubrication technologies used in order to protect the environment against possible pollution) .

The new revision should also achieve the goal to avoid any possible future reservations against its content.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

The task was initiated by the Panel on 2006, following the issue of reservation by part of some Member Societies against the contents of revision 2.

Notwithstanding several tentative by part of the Survey Panel members it was not possible to reach an agreed position mainly for what concern the periodicity of the surveys in relation to the different typology of propeller shafts layout and used lubrication media.

On June 2012 Survey Panel Chairman communicated to GPG that, despite the various endeavours, a common agreed position was not reached. As consequence GPG tasked the Survey Panel to establish an Inter Group Project Team (Survey/Machinery) with the following objective:
“to update the existing UR Z21 taking in account the all the Survey schemes individually applied by the Members and finding a common approach for related surveys”
with the aim to remove all existing reservations, avoiding any possible future reservation.

PT 20/2013 has been set, the following work item have been assigned (according to form A):
- Collection of the survey schemes of all IACS Members;
- Collection of the proposal of revision coming from all Survey/Machinery Panel Members
- Investigation (in cooperation with Machinery Panel member representatives) about the new building technologies that may allow new schemes of surveys
- Preparation of a(the) new harmonized scheme(s) of survey and introduction in a revision of UR Z21.

PT presented to Survey Panel the first draft of the revision 3 on August 2013. After reviewing the amendments identified by PT, Survey Panel members provided their comments to the drafted revision.

PT, after examination of the comments, prepared
- a new version of the draft addressing the comments and suggestions, and
- the technical justifications/explanations.

On February 2014 PT sent to the Panel the new version of the draft.

Draft was revised by the Panel at 19th meeting (March 2014) and further revised by correspondence. At 20th Survey Panel Meeting the final version of the draft has been agreed by the Panel members.

See TB document in Part B.

Technical Background Document
WP/SRC Task 1
New UR Z 18, Z21 and deletion of M20
(+ Rev.8 of Z7)

Objective and Scope:

To review existing UR M 20 and relocate it as a UR under UR Z.

Source of Proposed Requirements:

WP/SRC Chairman reported by e-mail 6 May 1999 that WP/SRC Members had discussed and reviewed the requirements contained in UR M20 through correspondence and at their last meeting and had relocated the text of M20 to a new UR Z18. A proposal for resolving ABS' existing reservations against M20 is included in the proposed UR Z18.

Points of Discussion:

WP/SRC unanimously agreed to the proposed draft UR Z 18.

Note by the Permanent Secretariat

GPG did not accept WP/SRC's proposal for resolving ABS' reservations since the proposal would not, in fact, lead to any greater uniformity in practice than by simply retaining ABS' existing reservations, and therefore did not approve the proposed UR Z18, pending receipt and consideration of an acceptable means of resolving ABS' reservations from the ABS GPG representative. The ABS GPG representative reported to GPG, at its 51st meeting on 2-4 October 2001 that ABS was not prepared to change its practice and that he could not identify any means of resolving ABS' reservations without significant change to other Members practices, which other Members were not prepared to accept.

Therefore, GPG expressed its preparedness to live with ABS reservation to the tail shaft survey requirements of ex M20 (now Z21), agreed to isolate it from Z18.

Outcome:

Delete M 20;

Create new Z18 excluding tail shaft survey requirements;

Create new Z21 for the tail shaft survey requirements.

Revision 8 of Z7 to have the same descriptions of special survey as those in Z10s and Z18.

(GPG considered it prudent to keep Revision 8 of Z7 in abeyance until WP/SRC complete its task to revise Z7.)

Date of submission: 6 May 1999
By WP/SRC Chairman's e-mail

Survey Panel Task 24 – Review UR Z21 and determine whether any revision is necessary to clauses 1(a)(i) and 1(b) based on service history and experience in the application of Z21, by member Societies.

Technical Background

UR Z21(Rev.1, April 2006)

1. **Objective**

To determine revision necessary, if any, to UR Z21 based on reservations submitted by GL.

2. **Background**

GL reservation for the applicable section of Z21 regarding omitting the fillet radius of the aft propeller shaft flange for a controllable pitch propeller by an approved crack detection method.

3. **Methodology of Work**

Panel member discussion through email correspondence.

4. **Discussion**

GL GPG member in June 2005 filed a reservation against UR Z21 as follows:
"Clauses 1(a)(i) and 1(b).
We reserve our position to omit the fillet radius of the aft. propeller
shaft flange for a controllable pitch propeller from the examination by an
approved crack-detection method, provided that the design is proven and has
been approved to be in full accordance to the rules.

The rationale behind this is that
1. Not a single damage has been detected in all such crack-tests performed
so far under GL's supervision.
2. The fillet radius area of flanges for CPPs can in most cases only be
crack-tested after a big and risky dismantling job."
Additionally, at the time of this request, a request was made to have the Survey Panel review UR Z21 to make amendments as necessary to address the GL reservation.
All members were requested to review their Societies vessels with CPP systems and determine if any problems have been found at the aft propeller shaft flange.
All members found that their vessels had not encountered any problems in the subject area and agreed to amend UR Z21 as necessary.
After correspondence by members, all agreed that in section 1(a)(i) 3, amendments could be made to NDT requirements, where NDT of the fillet radius of aft propeller shaft flanges may be required if visual exam is not satisfactory, and in (ii)(b) amendments were made where the crack detection test of the aft flange could be dispensed with for solid flange couplings at the end of shafts.

In addition, the Panel member from DNV proposed to amend the first paragraph of Z21 to allow shafts to not be removed for examination if alternative means are provided to assure the condition of the shaft, where alternative means are further describes in the latter paragraphs of Z21.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules/procedures. Assuming that GPG and Council approve the amendments, the Survey Panel would propose July 2007 as an implementation date.

Ref: 5074_IGj, 29 Mar 2006

TECHNICAL BACKGROUND

UR Z3 (Rev. 4), Z 7 (Rev. 14), Z18 (Rev. 2) and Z21 (Rev. 2)

Survey Panel Meeting March 2006 New Business Item – Applying UR Z3, Z7, Z18 and Z21 for Military Vessels.

1. **Objective**

To add the following new paragraph to UR Z3, Z7, Z18 and Z21 to reflect that special consideration may be used for military vessels:
"Special consideration may be given in application of relevant sections of this Unified Requirement to military vessels or commercial vessels owned or chartered by Governments, which are utilized in support of military operations or service".

2. **Background**

This task was originally discussed during the Survey Panel meeting, which took place at ABS Houston on the 1st to 3rd March 2006; it was subsequently recorded under paragraph 3 "new business" of the minutes of this meeting.
This initial started as a proposal for ABS to remove their reservation (see below) for military vessels against UR Z3 and Z7s. However all of the members agreed to the proposal.
Current ABS Reservation: "ABS allows variations in survey interval in agreement with US Government for military vessels or commercial vessels owned or chartered by the Government which are utilized in support of military operations or service."

3. **Methodology of Work**

Survey Panel members through correspondence.

4. **Discussion**

Survey Panel member from ABS raised this issue at the March 2006 Survey Panel meeting and volunteered to propose amendments to the applicable URs for Panel members to review and comment on through correspondence. At the Fall meeting of the Survey Panel, it was agreed upon by all Panel members that the proposed amendments for UR Z3, Z7, Z18 and Z21, which were proposed by ABS, were acceptable.

5. Implementation

The Survey Panel is of the view that the Members need 12 months from the adoption date to implement these amendments into their class rules. Assuming that GPG and Council approve to the amendments, the Survey Panel would propose January 2008 as an

implementation date.   However due to other on going revisions to UR Z21 this UR will be held abeyance until the other revisions are completed.

6. **Discussion at GPG:** GPG amended the proposal by deleting the phrase “military vessels or” on the basis that military vessels and other government ships operated for non-commercial purposes are out of the scope of IACS URs. The adopted amendment therefore reads:

“Special consideration may be given in application of relevant sections of this Unified Requirement to commercial vessels owned or chartered by Governments, which are utilized in support of military operations or service”.

Submitted by Survey Panel Chair, October 2006

Technical Background for UR Z21 Rev.3 (Feb 2015)

1. Scope and objectives

-To consider the revision of UR Z21 in order to evaluate the possibility to rationalize the survey methodology and survey schedule in order:

a) to consider the technological progress of the:
   - propulsion shafts and propeller;
   - their methods of lubrication,.

b) to address the existing reservations against the revision 2 of the UR Z21

c) to study the shaft surveys rules of each Society in order to draft a new common survey scheme that may be adopted in lieu, keeping in consideration the possible differences among the rules of the Societies.

d) To identify any other revisions required for UR Z21 by evaluating the proposals of Members.

2. Engineering background for technical basis and rationale

To achieve the scope and objectives the Survey Panel established ad hoc joint panel (Survey/Machinery) PT (PT 20/2013) with the aim to prepare the first draft of the Revision 3 of UR Z21. Leading role of the PT was assigned to Survey Panel.

Following the examination of the survey criteria for propulsion shafts set into the revision 2 of UR Z21, PT has investigated on the possibility to reconsider the interconnection of the request to carry a complete survey of the entire shaft (complete) in consequence of the type of coupling between shaft and propeller.

In addition, PT has considered the new systems of shaft lubrication, based on the use of fresh water in a closed loop similar to the one used for oil lubricated shafts.

New materials employed for shaft protection, against the corrosion, have been also taken under consideration in order to widen the family of those shafts which are allowed to work in a corrosion environment (sea water or moisture of sea water).

PT has also evaluated the information received by Panel Members relevant to their experience and feedbacks, especially for what concern the fresh water lubricated shafts in closed loop. In particular two Panel Members contributed with their wide experience on this kind of lubrication system by submitting their experience as follow:

Member 1: in Member1’s experience, for closed loop Fresh Water lubricated systems, there is no objection to the proposed 15 year interval (between complete survey) in view we have significant experience under Condition Monitoring of these types of system. This is provided the appropriate controls are in place, whose include:

- Water analysis at 6 monthly intervals.
- The pumping and water filtration systems are considered part of the continuous survey cycle and are subject to Periodical Survey.
- The shaft is to either be constructed of corrosion resistant material or protected with a corrosion resistant protective liner or approved coating.
- The glands are to be capable of being replaced without withdrawal of the shaft
- There is to be a shaft starting/clutch engagement block to inhibit starting the shaft until lubricating water flow has been established.

Member 2: The philosophy used in facilitating extended intervals (of shaft lubricated by fresh water in closed loop) aims to achieve an equivalent level of safety in design and monitoring aspects in force for condition based survey schemes for oil lubricated stern tubes (Tailshaft Monitoring).

The salient technical and classification aspects are addressed by ensuring satisfactory:

a) Corrosion protection of shafting and system.
b) Control and monitoring of quality of lubricant and system.
c) Performance monitoring of shaft and bearings.
d) Integrity
e) Periodical follow up inspections in service.
f) Relevant documentation.

The PT work has been extended also to the evaluation of the possibility to:

- confirm, as per actual Revision 2 of the UR Z21, that for flanged coupling system between propeller and shaft no dedicated verifications are necessary among the purposes of shaft survey(unless dismantled for other reasons).
- to extend the periodicity of the inspection intervals of the shaft taper for keyless coupling system between shaft and propeller.

On the basis of the technical feedbacks the PT confirmed that the actual provisions for flanged couplings (between shaft/propeller) are still applicable. For what concern the inspection of the shaft cone of the keyless couplings (between Shaft/Propeller) PT proposed to extend its periodicity from 10 to 15 years. In making the proposal PT evaluated the positive experience of the PT members relevant to the possible cases of damages affecting the shrinkage area of the shaft cone: these are quite rarely so that it can be assumed that the actual provisions for shaft design and selection of construction material are reliable. Moreover PT deemed appropriate to consider the fact that the area where the propeller is connected to shaft is working in the same environment (sea water) independently by the kind of shaft lubrication (oil closed loop, or fresh water closed loop, or water in open circuit): therefore the possibility to apply the periodicity of 15 years between to subsequent controls has been extended also to shaft lubricated by water in open circuit.

PT during the drafting of the revision has taken into consideration the principle that the new harmonized scheme needs to be flexible so that it can be applied by all Members. The aim has been achieved by finding and setting the minimum necessary requisites, for each kind of shaft survey, in order to grant that these cover the scope of the survey, granting its reliability. The flexibility of the harmonized system should leave the possibility to each Society to enforce the requirements in its rules as deemed necessary.

3. Source/derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

- New section 'definitions' was introduced to clarify the terms related to the shaft surveys.
- New scheme of harmonized shaft surveys has been introduced. The scheme expects the following:

Oil Lubricated Shafts: three methods of surveys (Method 1, Method 2, Method 3) having increasing severity, from less (Method 3) to high (Method 1)
Fresh Water Lubricated shafts (closed loop): three methods of surveys (Method 1, Method 2, Method 3) having increasing severity, from less (Method 3) to high (Method 1)
Water Lubricated Shafts (open loop): one method of survey (Method 4)

- The criteria of extension surveys, their scope and application methodologies have been introduced. The scheme expects the following:
  Oil Lubricated Shafts: three kinds of extension surveys (2,5 years extension survey, 1 year extension survey and 3 months extension survey).
  Fresh Water Lubricated shafts (closed loop): three kinds of extension surveys (2,5 years extension survey, 1 year extension survey and 3 months extension survey).
  Water Lubricated Shafts (open loop): two kinds of extension surveys 1 year extension survey and 3 months extension survey).

- The survey requirements for each kind of survey contemplated inside the revision 3 of the UR Z21

5. Points of discussions or possible discussions

1. PT proposed a first draft of the revision according to the assigned task (among the scope and objectives) .

2. Survey Panel reviewed the proposed amendments submitted by PT. Survey Panel proposed a list of comments to be sent to PT for clarification.

3. PT reviewed the Panel comments and the drafted revision 3 UR Z21 which was further amended.

4. PANEL reviewed the PT technical justifications and the new version of drafted revised UR Z21

5. At 20th Survey Panel meeting the draft was further amended and consolidated. Panel Noted that for what concern the analysis of the lubricating fresh water there will be necessary the development of an IACS recommendation that follows the principle of the IACS recommendation 36 for oil lubricated shafts.

6. Attachments if any

Nil

Technical Background (TB) document for UR Z21 (Rev.4 Oct 2015)

1. Scope and objectives

Analyse the GPG comments to the revision 3 of UR Z21 and verify the possibility to address them by drafting a new revision.

2. Engineering background for technical basis and rationale

With the revision 3 of UR Z21 it has been introduced new survey criteria for propulsion shaft systems based on the typology of shaft lubrication media and the methodology of propeller coupling to the shaft.

3. Source / derivation of the proposed IACS Resolution

Survey Panel Members, in consultation with their own Society's experts.

4. Summary of Changes intended for the revised Resolution

1) Editorial modifications as suggested by GPG Members
2) Revision of the criteria to apply the extension surveys
3) Rewording of the definition of "alternative means" in order to clearly exclude the shaft arrangements provided with the system for monitoring the working parameters from the application of the survey criteria set in the UR Z21 (Rev.3).

5. Points of discussions or possible discussions

The comments to revision 3 have been examined and technically dealt with as follows (reference is made to the corresponding paragraph of UR Z21):

- Paragraph 1.2.1 - Recommend changing "could mean" to "includes": the Panel concurred with the suggestion since clarify the sentence,
- Paragraph 2.3.1.2, 2.3.1.3, 2.4.1.2, 2.4.1.3 and table 2.5– We do not agree that there should be a difference for intervals of keyless and keyed connections and recommend the two sections be combined and include items A, B, and C.. The Society who issued the comments provided the following TB as support of its understanding

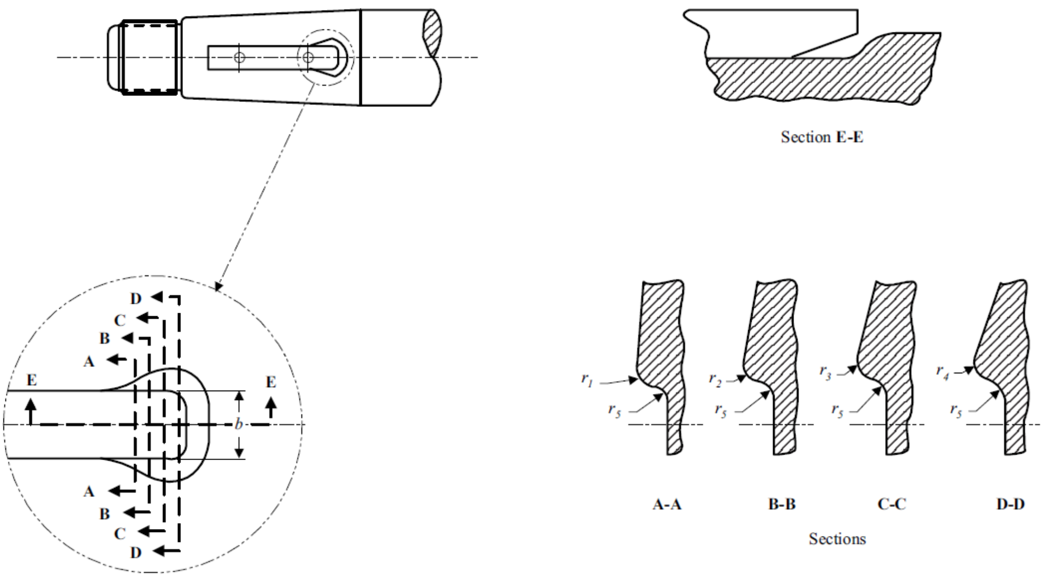
  QUOTE

  Keyed propeller shaft connections for large sea going vessels have not been used for probably the last 25 – 30 years. Therefore, very few vessels in service with an oil lubricated tail shaft have a keyed propeller connection. Most of the keyed connections for existing vessels are found on saltwater lubricated tail shafts which require the shaft to be drawn and NDE carried out in the keyway.

  The "old style" simple keys with no relief in the keyway forward are no longer accepted by IACS UR M68 and the Society recognizes the keyed type with spooned keyways for the longer survey interval. (Refer to drawing below on spooning). The spooning relieves the stress from the forward end of the key where fractures used to be found.

The limitations and details addressed for keyways, shaft dimensions and barred ranges, and the arrangement envisioned for keyed propeller shafts results in the same service experience considered for keyless propellers/shaft connections.

Typical Spooning of Keyway in Propeller Shaft



The Society has not required keyed connection to carry out a Method 1 or Method 2 survey at 5 year intervals for more than 35 years. We have not had any reported failures by allowing a 15 year interval for carrying out NDE in the keyway.

UNQUOTE

Majority of the Panel members (8 on 12) agreed that the technical background presented does not provide sufficient technical information to grant that cone part of a shaft, having a keyway in its tapered section, might not affected by defects due to the stresses at keyway edges, notwithstanding the spooned design, after a long period (e.g. 15 years) of working. Majority of the Members deems that the actual periodicity and methodology of survey of the taper, when a keyway is present, grant a safe margin in respect to the detection of the possible deficiencies which may affect the keyway edges and so the shaft cone. These considerations are confirmed by the long experience in the application of the provision of the UR Z21 and the ancestor unified requirement M20.

- Paragraph 2.3.2, 2.4.2 and table 2.5: it is proposed to modify the method of application of the various extension surveys as follow:
    - Extension up to a maximum of 1 year, no more than two consecutive "one year extensions" can be granted. No further extension, of other type, can be granted. In the event an additional extension is requested the requirements of the "2.5 year extension" are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of 2.5 years.
    - Extension up to a maximum of 3 months, no more than one "three months extension" can be granted. In the event an additional extension is requested the requirements of the "one year extension" or "2.5 year extension" are to be carried out and the shaft survey due date, prior to the previous extension, is extended for a maximum of one year or 2.5 years.

Majority of the Members concurred with the suggestions considering that the maximum allowable period of extension that can be granted is 2,5 years from the shaft survey due date. Therefore if an extension survey granting 1 year or 3 months is applied at the shaft survey due date and later on a more long extension is required, this last might be allowed by applying the survey criteria corresponding to the extension required and by crediting the new extension from the original shaft survey due date.

- Table 2.5: it is proposed to modify the position of note h, related to the application of survey method 1, to shafts lubricated by fresh water in close loop. Majority of the Panel Members concurred with the suggestion that make clear the table contents. Moreover, it is worth to note that in the GPG Member comment there was the proposal to split the note "h" in two notes and rewording them as follow:
  - *h: maximum of two consecutives Method 2 or Method 3 surveys. The maximum interval between two surveys carried out according to Method 1 shall not be more than 15 years.*
  - *i: maximum of two consecutives Method 2 surveys. The maximum interval between two surveys carried out according to Method 1 shall not exceed 15 years*.

This last proposal has not deemed necessary in order to clarify the table since the first part of the text, i.e. "maximum of two consecutives Method 2 or Method 3 surveys" does not correspond to the real scope of the note. In fact the note shall explain to the reader that a survey carried out according to method 1 shall be carried every 15 years (unless an extension of three months is granted). Thus in the time frame of 15 years there should be at least other two periodical surveys but this requirement should not prevent the interested parties to carry out more than two periodical surveys in the captioned time frame (it might be decided by the interested parties to carry three or more periodical surveys, instead of two, in between two surveys carried out according to method 1).

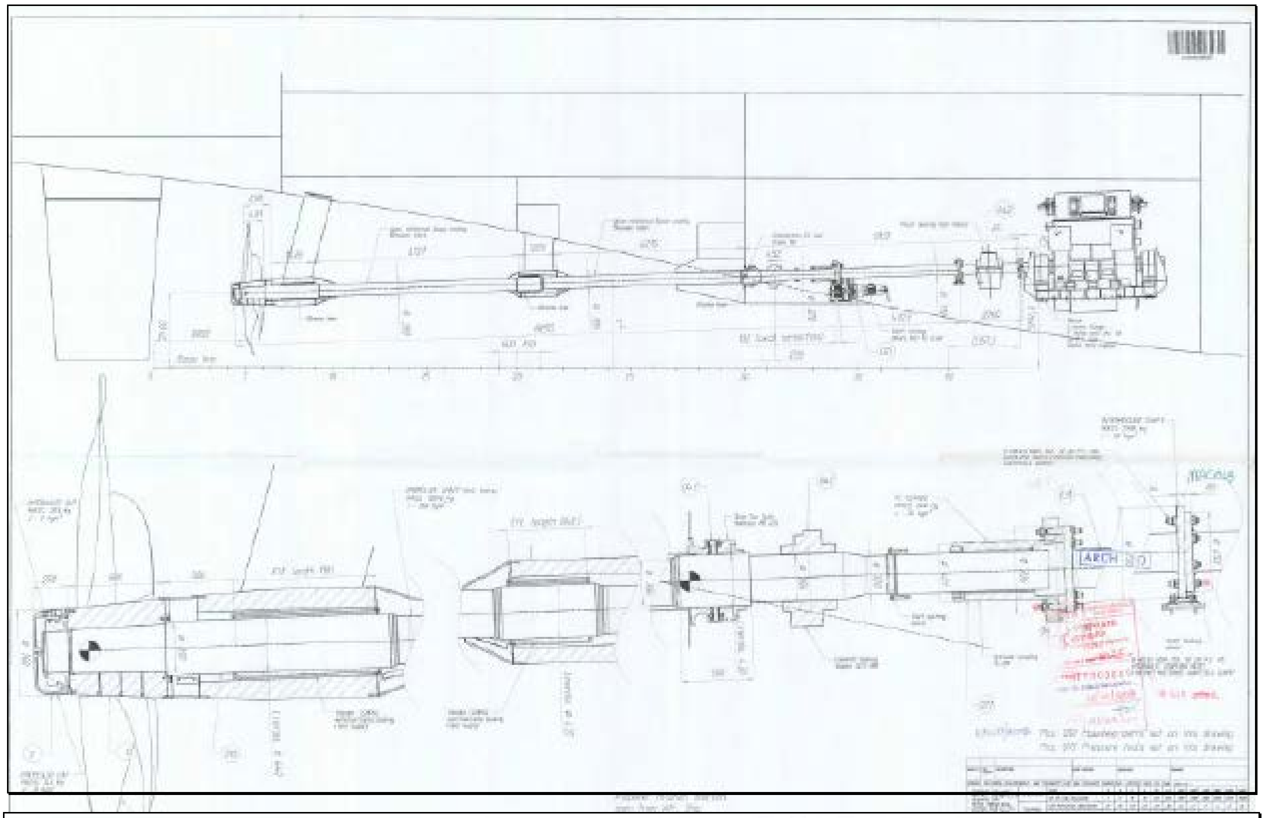
Taking present the above also the paragraph 2.3.1.2.C has been modified accordingly.

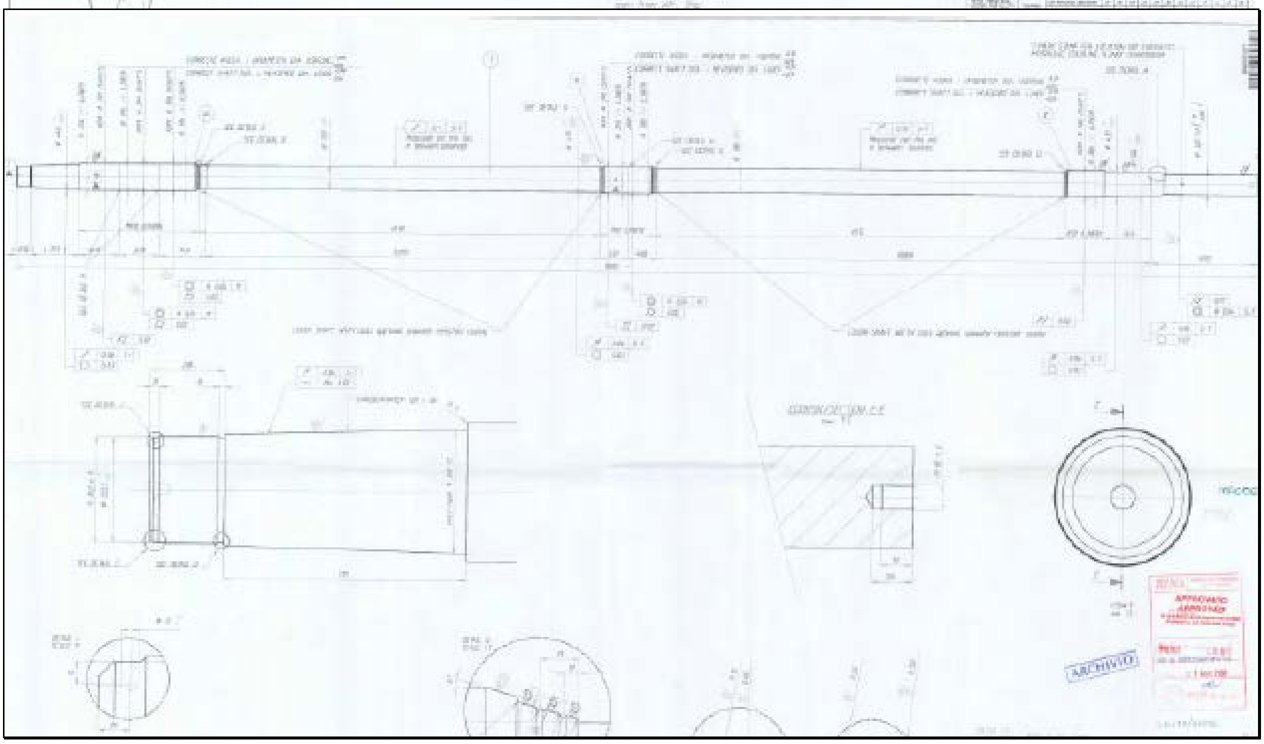
- Paragraph 3.1.1: it is proposed to reduce the periodicity of examination, through NDE (Non Destructive Examination), of the cone of propulsion shafts lubricated by water in open circuit, having the propeller coupled with keyless method, from 15 years to 5 years (i.e. in conjunction with the application of method 4 which expects the complete drawn of the shaft). The grounds of the proposal are the following:
  - The wearing of the bearings of a propulsion shaft lubricated by water in open circuit is different from that of a shaft lubricated by oil in closed circuit, hence the stresses are different and might affect the area of the propeller coupling.
  - that the propeller needs to be dismantled in order to drawn the shaft.

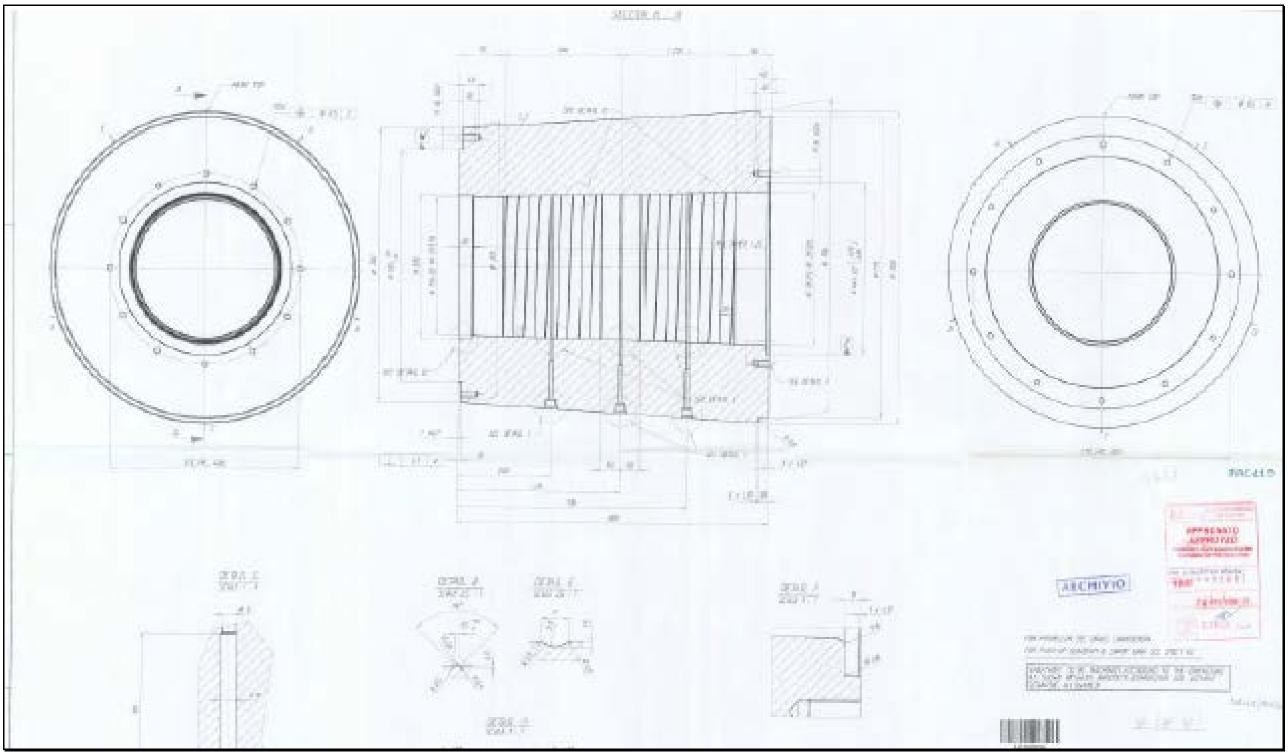
Panel already examined both issues during drafting of the revision 3 of UR Z21 with the help of the PT.

The first issue has been already examined, during the approval of Revision 3 of the UR Z21, on the basis of the hundreds positive feedbacks coming from hundreds propulsion shaft surveys performed and the precaution that every five years the clearance of the shaft/bearings, as well as the shaft weardown, shall be measured and evaluated and compared with the previous (trend analysis). Therefore an anomalous bearing wearing is easily detected and so there is no possibility to generate potential dangerous loads on shaft due to the failure of its supports (bearing). Moreover the issue was also satisfactorily reviewed by the members of PT 19 (who dealt with the revision 3 of UR Z21and where one of the members was selected by the Machinery Panel), whose promoted the periodicity of 15 years for propeller coupled with keyless methodology.

The second issue was already examined by the Survey Panel on the grounds of the following shaft arrangement where in order to examine the propulsion shaft and the tube shaft, both lubricated by sea water, it is not necessary to uncouple the propeller:







Considering that there is at least one existing arrangement to which the provision of paragraph 3.3.1 might be applied the majority of the Panel Members deemed to retain the paragraph as is. Moreover it has been considered that for the keyless coupling connection, of shafts lubricated by water in open circuit, most of the Societies possess positive records which demonstrate that this kind of coupling, if designed according the provisions set in UR M68, are reliable and for shafts/propellers not affected by other mechanical damages, e.g. due to contact or improper use, where the propeller is installed according to the manufacturer procedures do not shows any kind of defects when inspected (e.g. due to excessive shrinkage). However Panel also considered that the requirements of paragraph 3.3.1 do not prevent a Society to set more stringent requirements in its own rules.

6. Attachments if any

None.

Technical Background Z 22 (New. Dec 2002)

1. Scope and objectives

1.1 Following a casualty which had been partly attributed to water ingress through broken automatic air pipe heads, the AHG/FDF was charged with the following:

Objectives
- To establish design and inspection requirements for automatic “floating ball type“ air vents, situated on deck, especially on oil and chemical tankers.

Work Specification
- To identify current industry standards and practices.
- To consider problems identified on such a type of air vents, including design requirements, installation precautions, frequency of inspections, maintenance and replacement of elements, subject to deterioration.
- To consider improved means of protection against corrosion (treatment, coating) of the inner casing.
- To improve the design to facilitate the inspection and maintenance of the parts mostly exposed to corrosion (the connecting pipe inside the casing and air vent pipe).
- To take into account a better protection of air vents against green seas.

1.2 Members agreed that although the Form A specified only oil and chemical tankers, the UR should be applicable to a wider range of ship types. It was thus agreed to recommend extension to all cargo ship types, with consideration to passenger or other ship types and locations other than the exposed deck, to be given according to the requirements of each Society. This recommendation was included with the submitted UR to IACS for their consideration.

2. Points of discussions and possible discussions

2.1 The type and working principle of automatic air pipe heads have been discussed by the group. Also information about the mentioned casualty have been collected and discussed.
Taking into account the existing requirements in UR P3, and additional design recommendations made by the AHG to WP/MCH, it was considered that the main item to be improved was the survey requirements of automatic air pipe heads.

2.2 The AHG considered a proposal that the survey regime for stainless steel heads may be reduced. On advice from LR’s Chief Metallurgist, the group were informed that most normal grades of stainless steel react rather badly to the chlorine in sea water, causing a susceptibility to pitting corrosion. This pitting can occur even faster than the normal corrosion of mild steel, and in some cases has been found to cause penetration through the plate in a short time. Certain grades of stainless steel with a high pitting resistance – super duplex or super austenitic - would be acceptable, but these would increase the cost substantially. In view of this, and the difficulty for a surveyor of ascertaining the grade of stainless steel used in an existing head, it was decided not to reduce the survey regime for this type of head.

2.3 However, with possible future development of air pipe heads constructed from corrosion resistant materials, and proven good survey experience, a review of the regime specified in this UR may be considered appropriate.

3. Source / derivation of proposed requirements

The group collected information regarding current automatic air pipe heads service and noted that, in some cases it is not possible to fully inspect an automatic air pipe head from outside and that dismantling from its air pipe, would be necessary for accessing the internal parts.
It was therefore decided to clarify the matter, in respect of extension and procedures for inspections for such a kind of automatic air pipe heads.

4. Decision by voting if any

The proposed UR was considered by all Members of the AHG and was agreed unanimously.

5. Note by the Permanent Secretariat

WP/SRC had reviewed Z22 and the AHG/FDF recommended Council as follows:

	WP/SRC	AHG/FDF
1	Z22.1.1: It should apply to all ships except passenger ships. Suggests that the AHG develop requirements for air pipe heads of passenger ships.	AHG agreed. Council tasked GPG to consider.
2	Z22.2. Suggests that the requirement for removal of the head from the air pipes should be deleted.	In view of the aforementioned casualty, the AHG recommends that it should be left as is.
3	Z22.2. Suggests that recoating according to the paint manufacturers' procedures should be required if the zinc coating has broken down.	This should be for individual Societies to determine effective repairs as is their current practice.
4	A reference to Z22 should be included in Z7. Internal conditions of the pipes in the area of weld connection with the deck has not been considered. It should be addressed in a UR.	Agreed. WP/SRC Chairman is to bear this in mind. Survey requirements for air/vent pipes is a separate issue to be addressed in Z7 or in a separate UR. GPG is to further consider.

- Adopted on 23 December 2002
- Council tasked GPG to examine the remaining issues as summarized in the Table above. There are two remaining issues:
  Question 1. Whether to develop separate survey requirements to air-pipes on passenger ships,
  (Yes: DNV, CCS;

No: ABS, KR, RINA, BV, NK, LR, GL, RS)

Question 2. Whether to develop uniform survey requirements for air-vent pipes including the welded connection to deck (as a separate UR with reference to this UR in Z7).
(Yes: ABS, RS, DNV, GL, KR, CCS, BV, RINA)
(NK, LR and GL: to de decided by GPG)

For further developments, refer to correspondence under s/n 2172a.

****

UR Z 23 "Hull Survey for New Construction"

Summary

To update the reference in appendix 2 due to adoption of Resolution MSC.454(100) which revoked Resolution MSC.296(87)

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Corr.2 (May 2023)	17 May 2023	-
Corr.1 (Oct 2022)	04 October 2022	-

New (July 2006)	31 July 2006	1 January 2008

- **Corr.2 (May 2023)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

As Resolution MSC.296(87) was revoked by Resolution MSC.454(100), the reference in appendix 2 was to be updated accordingly.

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

4 History of Decisions Made:

As Resolution MSC.296(87) was revoked by Resolution MSC.454(100), the reference in appendix 2 was to be updated in a similar manner to Corr.1 of this UR.

5 Other Resolutions Changes:

None

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal	: 12 January 2023	(PSU23004_ISUa)
Panel Approval	: 15 March 2023	(Ref: 37th Survey Panel Meeting)
GPG Approval	: 17 May 2023	(Ref: 22142_IGd)

- **Corr.1 (Oct 2022)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

As ISO18001 (OHSAS18001) was replaced by ISO45001, the reference in appendix 1 is to be updated to ISO45001.

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

4 History of Decisions Made:

As ISO18001 (OHSAS18001) was replaced by ISO45001, the reference in appendix 1 is to be updated to ISO45001.

5 Other Resolutions Changes:

None

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal	: 26 August 2022	(Made by a Survey Panel Member)
Panel Approval	: 08 September 2022	(Ref: PSU22046)
GPG Approval	: 04 October 2022	(Ref: 22142_IGb)

- **Rev.7 (Oct 2020)**

1 Origin of Change:

☑ Suggestion by IACS member
☑ Request by non-IACS entity (*IMO GBS auditor*)

2 Main Reason for Change:

2.1 A global unified standard is required to improve the installation and maintenance of Pressure-Rated MCT/Transit systems. In order to properly maintain Ship and Mobile Offshore Unit structures and promote vessel safety during water ingress a better method is necessary to document and manage installation, maintenance, and repair of MCT/Transit systems. By improving documentation during initial installation, incorporating the installation information into a systemized maintenance plan, and using knowledgeable authorized/approved service entities to conduct inspections and manage repairs or alterations, the risks of MCT failures will be reduced. This will mitigate potential safety and environmental incidents as a result of service oversights and exposure to onboard flooding damage conditions.

2.2 During the initial GBS compliance audit of the CSR for BC&OT the IMO GBS auditors observed that there is no established process for accepting the use of fabrication standards in lieu of IACS Rec. 47. Therefore, IACS received an "observation" as a Finding of the GBS audit.

2.3 During the IMO GBS 2018 audit it was observed that in UR Z23 Rev.5, Table 1 lines 1.4 and 1.5, "NDE" is amended to "NDT" several times which are inconsistent with the term NDE remaining unchanged in 5.1.5.2c) and 5.1.5.2h) of the revised Z23 and in the CSR-BC&OT (2018) in 4 of Ch. 12 Sect. 2. Therefore, IACS received an "observation" as a Finding of the GBS audit.

2.4 As Recommendation 20 is to be deleted, and the newly developed UR W33 is to be uniformly implemented on or after 1st July 2021, the items 1.3c, 1.4 and 1.5 of Table 1 are to be updated with the term "Recommendation 20" being replaced with "UR W33".

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

4 History of Decisions Made:
4.1 A member of the Survey Panel raised the issue of survey requirements during the 24th Survey Panel Meeting. In detail under discussion is the concept for the preparation of an IACS tool (a Recommendation or an UR, whichever deemed more appropriate) which addresses the complicated and arduous activities associated with the particular inspections required for class to accept the continuous integrity of the multi cable transit from the time of their installation till to the end of the ship's life.

In this respect the Survey Panel discussed the topics and agreed that a PT dealing with the matters would be advisable in order to provide suggestions for the possible revisions of the relevant IACS Resolutions (e.g. Z23, Z7, Z15, and Z17)

PT PSU32/2017 was established, and made revisions to URs Z23, Z7 and Z17, with the following of UR Z23 being addressed:

- Insert new paragraph 10.2.5.1 to the main text.

- Insert new paragraph 3.1.1.9.1 to the Appendix 2.

- Insert new Appendix 3, Recommendatory Sample of Cable Transit Seal Systems Register

PT's proposal was submitted to the Survey Panel on 11 August 2017, panel members concurred with comments on PT's submission and proposed actions were taken by the PT. Survey Panel reviewed the drafts which was further amended and agreed by Survey Panel on 14 March 2019 during the 29th Panel Meeting.

Realizing that the UR for approval of Service Suppliers for the inspection of Cable Transits is newly developed by IACS, before enough Service Suppliers being approved, it might be premature to push out the UR for the inspections to the cable transits of ships in service, the members agreed to push out the IACS URs step by step, and firstly to work out the revision to UR Z23 to include the requirement of the "Register" for new construction ships, and the revision to UR Z17 for the details of the approval requirements of the Service Suppliers for the inspection of Cable Transits, and secondly to complete the draft of the new URZ (other than revising URs Z7 and Z15) in a later time with all the survey requirements to the cable transits, leaving the mandatory requirements for the service supplier to be considered in the future.

As proposed by one member, Survey Panel further considered to insert a new hull inspection item of Watertight Cable Transit Seal System into Table 1 of UR Z23, and agreed to insert a new item 8.6 for this purpose. During the 30th Survey Panel meeting, the panel finalized the contents of item 8.6 of Table 1 of UR Z23.

After the 30th Survey Panel meeting, the panel finalized the new UR Z28 and the revisions to URs Z23 and Z17.

Refer TB Document in Annex 5 of Part B.

4.2 For addressing an IMO GBS observation made during the 2015 IMO Audit (PSU18004)

IACS decided to address all observations made by the GBS Audit Teams. Therefore the Hull Panel PT PH36 team assigned to address this observation prepared a GBS Corrective Action Plan submitted to the IMO in Dec 2015. It was decided to add a procedure for accepting the use of a recognized fabrication standard (RFS) in lieu of Rec. 47 in paragraph 7.4 of UR Z23.

This topic is also mentioned in Pt 1, Ch 12, Sec 1, [1.2.1] of the CSR for BC&OT, therefore reference to paragraph 7.4 of UR Z23 is made in the technical background of this CSR rule section.

4.3 For addressing an IMO GBS observation made during the 2018 IMO Audit (PSU19051)

During the discussions, the qualified majority of Survey Panel agreed to use the term "NDE" in the Table 1 of UR Z23 other than "NDT", consisting with the main text of this UR, with the relevant contents in IACS CSR for BC & OT being unchanged.

4.4 Deletion of Recommendation 20

As Recommendation 20 is to be deleted, and the newly developed UR W33 is to be uniformly implemented on or after 1st July 2021, the items 1.3c, 1.4 and 1.5 of Table 1 were updated with the term "Recommendation 20" being replaced with "UR W33".

5 Other Resolutions Changes:

URs Z17, Z28, W33

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

7.1	Original Proposal:	29 September 2016 Made by A Survey Panel Member	
	Panel Approval:	8 December 2019 (Ref: PSU16049)	
	GPG Approval:	02 October 2020 (Ref: 16222_IGv)	
7.2	Original Proposal:	13 Feb 2018	Made by: PT PH36
	Panel Approval:	18 Nov 2019 (Ref. PH15014_IHbi)	
	GPG Approval:	02 October 2020 (Ref: 16222_IGv)	
7.3	Original Proposal:	31 October 2018	Made by: EG/GBS(18122a)
	Panel Approval:	25 November 2019 (Ref: PSU19051)	
	GPG Approval:	02 October 2020 (Ref: 16222_IGv)	
7.4	Original Proposal:	28 November 2019	Made by: GPG (13202_IGzg)
	Panel Approval:	8 December 2019 (Ref: PSU16049)	
	GPG Approval:	02 October 2020 (Ref: 16222_IGv)	
7.5	Panel Approval:	21 September 2020 (Ref: 16222_PYg)	
	GPG Approval:	02 October 2020 (Ref: 16222_IGv)	

- **Rev 6 (Nov 2016)**

.1 Origin of Change:

☑ Suggestions by IACS member
☑ Other (Corrective Action of the OBS 7 to the IACS CP1 on GBS)

.2 Main Reason for Change:

To address the Observation 07, raised by the IMO Auditing Team 5 of the IACS common package 1 in respect to the functional requirements (FR) 9-15

To address the Observation 04, raised by the IMO Auditing Team 5 of the IACS common package 1 in respect to the functional requirements (FR) 9-15.

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

a) In order to address the Observation 07, related to the provisions to ensure that areas of high stress or fatigue risk are surveyed, Panel discussed, under tasks PSU 16006 and PSU16006b, the modification of the table 1 annexed to UR Z23. During the 24th meeting Panel Members concurred that the areas subjected to high stress fatigue, and in general the critical structural areas, should be subjected to witnessing in lieu of the patrolling. Panel Members agreed to modify the "Survey method required for the classification" of the item 2.5, of table 1, from "patrol and review" to "witness and review" according to the definition of Patrol, Review and Witness provided at paragraphs 2.3.1, 2.3.2 and 2.3.3. of UR Z23.

b) Following to a GPG Member's proposal Panel examined, under the task PSU16017, the possible modification of the UR Z23 in order to include the activity of the verification of the Ship Construction File (SCF) before the ship's delivery. The suggested text was discussed by the Members and it was concurred that since the issue might be regarded as a proactive extension of the corrective action to OBS 04 this should be added in appendix 2 of the UR Z23. Members examined the proposed text and the relevant proposal of its modification. During the 24th Survey Panel meeting agreed to add the new paragraphs 3.2, 3.2.1 and 3.2.2 into the appendix 2 by noting that the use of the word "review" in paragraph 3.2, according to the definition of paragraph 2.3.2 of UR Z23, has the following scope:

   "REVIEW" means the examination of the SCF that is carried out by the surveyor, at the end of the newbuilding process, in order to confirm that:

   - drawings and documents required under the paragraph 3 of the appendix 2 to the UR Z23, plus
   - the possible additional drawings/documents provided by the shipyard, as per the Ship Constructional File (SCF) list of drawings/documents

   are present in the copies of the SCF stored on board and in the ashore archive. The "REVIEW" is not to be intended as an assessment of the drawings/documents in order to verify their compliances with the applicable Rules/Regulations"

During the 24th Panel meeting Members concurred to merge the conclusion of the task PSU16017 to those of PSU16006b (former 16006) so that only a single revision of UR Z23 (revision 6) is produced.

5 Other Resolutions Changes:

None

6 Dates:

Panel Approval: 09 September 2016 (Ref: PSU16006b & PSU16017)
GPG Approval: 25 November 2016 (Ref: 15124bIGk)

- **Rev 5 (Feb 2015)**

1 Origin of Change:

☑ Suggestions by IACS members

2 Main Reason for Change:

To address a finding raised by a Quality Auditor relevant to the missing recording of the patrolling activity expected into the table 1 annexed to UR Z23.

To modify the scope of the Survey Method required for Classification of the items 1.3c, 5 and 6 of table 1 annexed to UR Z23 in order to indicate the appropriate methodology of survey.

3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

a) During the 19th Survey Panel Meeting a Member sought the Panel opinion about a finding raised during a quality audit and relevant to the no satisfactory recording of the patrolling activities.
Each Members of the Survey Panel explained its own Society's procedure used in order to record the patrolling activity. Members decided to explore the possibility to create an IACS form in order to reporting it.
Panel discussed the proposal under PSU 14006. During the discussion it has been observed that the majority of the Societies already possess proper software where patrolling activities are recorded.
Panel acknowledged that the creation of a dedicated form may lead to uncomfortable modifications of the software of each Society; hence Panel decided that the reasonable solution is to formalize, inside the UR Z23, that at least the deficiencies found during the patrolling activities shall be recorded. The new paragraph 9.2 has been added to UR Z23, this establish a minimum data requirements in order to record each deficiency.
No technical background has been expected for this modification.

b) Following the examination of the survey requirements listed in table 1, a Member noted that the requirements for the item no. 5 (Tightness testing, including leak and hose testing, hydropneumatic testing) were not correctly addressing the intended activity.

Panel discussed the modification to be applied under the task no 14018 and following the revision of the table it has been noted that also item 1.3c and item 6 needed to be analysed and modified.
The following wording has been respectively agreed:

- Item 1.3c of table 1: from *"Patrol"* to *"Review and patrol"*
- Item 5 and item 6 of table 1: from *"patrol of the process and witness of the test"* to "*Review and witness of the test* ".

The items 5 and 6 have been agreed by correspondence while item 1.3 has been agreed at 20th Survey Panel meeting.
At the Panel meeting Members concurred to merge the conclusion of the task PSU14018 with those of PSU14006 so that only a single revision of UR Z23 (revision 5) is produced.

5 Other Resolutions Changes:

None

6 Dates:

Panel Approval: 05 September 2014 by Survey Panel (Ref: PSU14006 and PSU14018)
GPG Approval: 24 February 2015 (Ref: 15012_IGc)

- **Rev 4 (Mar 2014)**

1 Origin of Change:

☑ Request by non IACS entity (INTERTANKO, BIMCO)

2 Main Reason for Change:

To consider the comments made by industry (INTERTANKO, BIMCO) during the review of URZ23.

3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

c) During the review of previous revision to UR23 (Rev.3) which was revised to comply with IMO GBS guidelines external entities INTERTANKO and BIMCO proposed some amendments to UR Z23.
d) GPG tasked Survey Panel to review the modifications/suggestions proposed by the Industry which were not relevant to IMO GBS guidelines and advised to revise the URZ23 as appropriate.
e) Panel discussed the proposals received from Industry and revised UR Z23. Present revision of UR Z23 reflected only the proposals of Industry which were agreed by the Survey Panel (PSU13043).

f) Moreover, item 7.1 of Table 1 was editorially amended as per the outcome of Panel task PSU13044.

5 Other Resolutions Changes:

None

6 Dates:

Panel Approval: 7 November 2013 by Survey Panel (Ref: PSU13043)
GPG Approval: 14 March 2014 (Ref: 10060fIGs)

- **Rev 3 (June 2013)**

1 Origin of Change:

☑ Based on IMO Regulation (MSC.287(87), MSC.290(87), MSC.296(87))

2 Main Reason for Change:

At C62, IACS Council noted the report on the CSR/GBS gap analysis related to identified gaps which should be covered by the harmonised CSR. On that occasion, Council noted that there are gaps which will not be covered by the Harmonized CSR and which could be closed by modifying existing IACS technical resolutions to comply with GBS Guidelines.

3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

Survey Panel discussed to revise UR Z23 in order to comply with the IMO Ship Construction File (SCF) Guidelines and relevant requirements of the GBS Guidelines related to design transparency and construction surveys.

A Small Group (SG) was formed under Survey Panel consisting 3 Panel Members which submitted the proposed revised draft UR Z23 to Survey Panel during 15th Survey Panel meeting. A whole new appendix ('Appendix 2') has been added to the existing UR Z23. Proposed revision of UR Z23 was agreed by the Survey Panel at 16th Panel meeting.

5 Other Resolutions Changes:

None

6 Dates:

Panel Approval: 19 September 2012 by Survey Panel (Ref: PSU11025)
GPG Approval: 05 June 2013 (Ref: 100060fIGn)

- **Corr.1 (August 2012)**

1 Origin of Change:

☑ Suggestion by an IACS member

2 Main Reason for Change:

To remove the reference to PR34 in UR Z23 as PR34 was deleted on 1 July 2012.

3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

The proposal was made by an IACS GPG member. PermSec drafted the correction.

5 Other Resolutions Changes:

None

(TB: Pre - External Review of the draft UR Z23, issued December 2005)

<u>Technical Background Document (UR Z23, New. 2006)</u>

<u>(Post - External Review of the draft UR Z23)</u>

Notes from Meeting EG/NCSR 24th and 25th May 2006

Prepared by the expert group for New Construction Survey Requirements

A meeting of the expert group was held on the 24th and 25th May 2006. The purpose has been to review the comments to the draft UR which have been made by industry and to discuss the next stages of the EG's work. The EG's response to industry comments is shown below. The EG would like to thank industry for the comments, some of the comments have been incorporated into the draft, our response to other comments are shown in this technical document. Wherever possible we have referred to paragraph numbers from the individual industry response letters.

There is an overriding comment from the shipowner groups and EMSA that the UR does not provide consistency. To counter this, it is proposed to modify table 1. The final column "Classification society proposals for the project" needs to have the ability to be expanded to allow classification comment to be added and to remove the criticism that the column is merely a check box. This can be achieved by issuing the table electronically. No other changes to the table are proposed.

The appendix has been extensively amended – and re-titled – to reflect the purpose of the examination of the shipyard, i.e. to review facilities. The amended appendix is also enclosed.

<u>SAJ comments</u>

1. Agree

2. Paragraph 10.2 purpose is to provide documents to facilitate inspection, repair and maintenance and should remain in the UR as shown. One advantage of the table will be as an aide memoire for surveyors, rather than for them to check back to the UR. Also, it provides clarity as to the documents which IACS do not require, this will eventually assist both shipbuilder and shipowner. We understand SAJ's concern about shipowners requiring information without giving too much thought as to the implications of their request, stating "not required" can help them. As an example, we would not expect a list of welding consumables to be listed in the SCF because this could be construed in the future as the only consumables which could be used in a future repair, when in fact any compatible consumable would be allowable.

   Propose to modify 10.2.

   It is recognised that the purpose of documents held in the Ship Construction File on board the ship, is to facilitate inspection (survey) and repair and maintenance, and, therefore, is to include in addition to documents listed in table 1, but not be limited to:

Delete 10.2.10

3. Table 1 is intended to be an aide memoire for surveyors. The table includes both recommendations as well as requirements and the comment is added to remind surveyors of the difference.

4. Answered separately.

<u>Chinese Shipbuilders comments</u>

1. It is confirmed that the builder may not provide formal certification for items such as hatch covers which have been manufactured in shipyards and only provide documents such as endorsed inspection records. This is acceptable documentary evidence provided that it has been endorsed by the classification society as required by 3.3

2. No requirement for re-assessment on a periodic basis if active in the shipyard and where no major changes have occurred.

   Return to definition of impact

   The purpose of the assessment is to assist the classification society to plan for survey of the newbuilding and the individual society must carry out its own assessment

3. It is proposed to modify paragraph 10.1 as follows:

   The shipbuilder is to deliver documents for the Ship Construction File. In the event that items have been provided by another party such as the shipowner and where separate arrangements have been made for document delivery which excludes the shipbuilder, that party has the responsibility to deliver the documents.

<u>INTERTANKO comments</u>

1. Concerning coatings, it is proposed that no further changes are made until instructions are made by IACS.

UR paragraph number

1.1	Amended
2.1.f	refers to ILLC only, piping supports covered by 2.1.g
2.1.g	amended
2.3	Propose that the term “Patrol” is maintained. Verification can take place at all three stages of patrol, review and witness. Comment on documentation covered by paragraph 9.1
3.3	amended to “shall”.
4.1	Comments noted but no change to text proposed.

5.1.5.2.i	Assume that this should read "straightening" and not "strengthening", this already covered in table 1 row 2.2 – also amended to add "fairing". No other changes proposed.
6	This paragraph is to provide information for the classification society to understand capability of the shipyard, it is not meant to be a quality assessment of the shipbuilder. It is agreed, as stated in the UR, that it is also applicable to sub-contractors.
7.1	"Patrol" to be maintained – previous comments refer. No need to state that class will make the meeting record. Comment noted but no further amendment proposed.
7.4	Plan approval is not covered by this UR. Plan approval will make reference to any specific tolerances over and above normal shipyard building standards. The builder and shipowner must have the option to mutually agree to use a national or their own standards providing they are acceptable to the classification society – the text of the UR reflects this. No changes to the text are proposed.
7.5	Fully accept that it is beneficial to the project if the other interested parties attend the kick off meeting and the classification society will have no objections in them doing so. No change to text proposed.
7.6	Propose to add the following sentence. " Notwithstanding this, the benefits of a new shipowner attending a kick-off meeting for an existing series of ships for a project cannot be underestimated and would receive the full support of the classification society."
8.1	This plan is very often approved by the surveyors attending in the shipyard and not by the plan approval office, no change to text therefore proposed.
9.2	Comments noted but propose that no changes to the UR are made. Current text is adequate.
10.2.1	Propose addition to row 4 "details required" for ship construction file, no addition to paragraph 10.2.1
10.2.4	Outwith this UR, covered by other IACS working group
10.2.11	statutory issue – to be covered by the green passport, propose that this paragraph is deleted
10.2.12	outside of the scope of this UR, propose that this paragraph is deleted

<u>Intercargo comments</u>

1.1	Paragraph amended, no further amendment proposed.
1.2	Comment noted, no amendment to UR proposed.
2.3.1,2,3	Comments noted, patrol is primarily visual. It verifies that the shipbuilding processes are being performed in a satisfactory manner. It aims to detect systematic errors, early detection of possible deviations. It is part of the process to ensure that traceability is in place. The proportion between scheduled and unscheduled will vary between shipyard to shipyard and between different ship types. It will depend upon the repetitive nature of the production process as well as the amount of mechanisation in place in the shipyard. It can even vary within workstations within a shipyard depending upon the complexity

of the operations. Concerning the comment “What is the verification/correction requirement for the unscheduled and scheduled site survey results?” – the classification society will draw the attention of the shipbuilder to any problems found, through direct contact with the shipbuilder through agreed channels of communication.

2.3.3	“Examination” as defined in paragraph 1.1 covers the whole process of classification – no further definition proposed.
3.1.b	Amended
3.2	Paragraph 1.1 amended to refer to statutory
3.5	Comment noted
4.1	Comment noted but is covered by existing paragraph 9.1
5.1	Remedial work will be carried out using agreed procedures which can be based upon Recommendation 47, classification rules, or agreed shipyard fabrication standards. The columns of “Survey Requirements”, “Survey Method” and “Specific activities” are adequate – the classification society’s response will be more detailed and will be defined at the kick off meeting. It is acknowledged that column “Classification society proposals for the project” in table 1 may give the impression of a “tick box”. This is not the intention. It is proposed to modify table 1 so that the classification society can enter a fuller description as to how the survey will be carried out for all activities.
6.1.3	Coatings are outwith this UR other than the extent mentioned in table 1
7.2	Comments noted but no changes to text proposed. All IMO and flag requirements applicable at contract agreed dates will be adhered to provided that the classification society is made aware of the contract requirements.
7.5	Fully accept that it is beneficial to the project if the other interested parties attend the kick off meeting and the classification society will have no objections in them doing so. No change to text proposed
8.1	Comment already covered by paragraph 8.2
10.2.1	Comment noted about as built drawings, however, this UR makes reference to IACS only and not IMO documents. Comment concerning materials already covered in the paragraph. Concerning welding procedures, these are the copyright of the shipbuilder who will be under no obligation to provide them to the ship. Also, a welding procedure is governed by local conditions and

procedures would likely need to be re-approved in the event that remedial work is carried out a different location using a different contractor, material and consumables. No changes to the text proposed.

10.2.11 statutory issue – to be covered by the green passport, propose that this paragraph is deleted

10.2.12 outside of the scope of this UR, propose that this paragraph is deleted

EMSA comments

1. The draft UR concentrates on the hull survey of new construction and only deals with statutory aspects where they co-incide. It is the intention to deal with statutory aspects in the next phase of development of the UR. As an example, fire aspects of Safety Construction certification are not included in the present phase of the UR.

   IMO Res.A.948 (23) has not been explicitly referred to in the UR, neither has any other IMO resolution or circular. Our group has continually referred to such IMO documents throughout the period that we have developed the UR, however, we understood that we only needed to make reference to IACS and not IMO documents.

   Problems with checklists noted.

2. Comments noted. Paragraphs 1.1 to 1.4 define a scope, the text defines how the scope is dealt with. For example, “and by whom” – in paragraph 1.3 – is dealt with in paragraph 4. IACS has clear requirements for the qualification and monitoring of surveyors.

3. Comments noted and paragraph 2.3 has been amended

4. Comments noted. There is a whole process involved in surveying new construction in accordance with approved plans. It is the responsibility of the shipbuilder to ensure that the information shown in the most up to date version of approved plans has been passed into the production cycle and for the classification surveyor to ensure that this is the case.

5. The assessment of the production facilities is not an assessment of the quality of the shipbuilder (or Sub-contractor). It is to assist the classification society to assess how best to deal with the survey of the shipbuilding project in question. The whole purpose of the classification process is product verification for a specific project. Appendix 1 – as shown - is still under development.

   The situation of a shipyard which is in a state of development is taken into account – this is done through the kick-off meeting referred to in paragraph 7.

The remaining comments in paragraph 5 acknowledged and appreciated

6. Concerning shipbuilding standards. IACS recommendation 47 is a guide. Established national standards may exist which have different tolerances than IACS recommendation 47 – such standards have been developed and based upon satisfactory service history – and are acceptable. This is reflected in Table number 1. Comments noted about developing shipyards.

7. EMSA's concerns appreciated. The members of this group stated that there is no uniform retention period and further discussion on the subject is required. It is proposed that this comment is referred to IACS Council for discussion on the relevant legal/quality group.

8. The extent of surveyor involvement has to be agreed project by project at the kick off meeting, which is described in section 7. It is acknowledged that column "Classification society proposals for the project" in table 1 may give the impression of a "tick box". This is not the intention. IACS Council is requested to provide this table in electronic format to enable column "Classification society proposals for the project" to be expanded to allow sufficient comment to be made for each activity by the classification society. The classification society may wish to use this table in paper or electronic format. The examples quoted at the end of paragraph 8, i.e. paragraphs 1.4, 2.5 and 3 will also be covered in table number 1.

General comment

Many industry comments refer to coatings, this subject has not been discussed in depth by the EG. At the time of our meeting we were not aware of consensus from IACS. It is also understood that IMO are involved in this subject and it is proposed that this subject is further discussed by this EG during the next phase when we have been asked to review statutory issues.

The EG members agreed that the present incumbent chairman retains the position to assist in any discussions required with industry.

Under cover of document dated 25th January 2006, the EG have been tasked to develop a UI for initial statutory surveys at new construction. The EG members have requested confirmation if Form A will be issued for this task.

The next meeting of the EG is planned for September/October 2006 and the intervening period will be spent reviewing this task and entering a period of data gathering.

The EG requests confirmation that the task does not involve interpretation of statutory requirements – it is considered that this is the task of other statutory groups within IACS.

Conclusion

The EG chairman will be pleased to provide further clarification if required.

Once more, on behalf of the EG, thank you for the opportunity to be involved in the development of this UR and we wish IACS success in its dealings with industry.

J.J. Finch

IACS EG Chairman - New construction survey requirements

19th June 2006

* * *

Permanent Secretariat Note:

1. Council concluded that the EG/NCSR is to tasked to develop a UI for initial statutory surveys at new construction. This task does not involve interpretation of statutory requirements. Task Form A to be submitted. 4009_ICn, 14 Aug 2006.
2. EG/NCSR is to further discuss the issue of coating in its review of statutory issues, consulting with the EG/Coating, the development in IMO should also be taken into account.

3. Concerning Table 1:

The 2nd paragraph of the preamble of this TB (page 1) reads as follows:

> There is an overriding comment from the shipowner groups and EMSA that the UR does not provide consistency. To counter this, it is proposed to modify table 1. The final column “Classification society proposals for the project” needs to have the ability to be expanded to allow classification comment to be added and to remove the criticism that the column is merely a check box. This can be achieved by issuing the table electronically. No other changes to the table are proposed.

It was confirmed that Table 1 should be made available to users in an Excel format, so that comments can be added to the column *‘Classification scoeity proposals for the project*’.

END

New UR on New Construction Survey Requirements

Prepared by the expert group for New Construction Survey requirements

1. Objectives

The EG was guided by the objectives in the Form A which had been decided at C50/GPG 58:

1. Develop comprehensive Unified Requirements for surveys, focusing on hull structures, as part of the classification and statutory certification process of a new building to verify that ships comply with the relevant Rules and Regulations (i.e. before being put into service for the first time).

2. Establish a link between the classification and statutory surveys (where delegation applies), the developed URs and draft goal based standards being developed at the IMO, aiming at ensuring the clear, comprehensive and consistent application of classification rules and relevant statutory requirements, including UIs, at the shipyards and their sub-contractors.

3. With reference to the draft UR developed by AHG/NCSR, ensure that a more comprehensive and more robust UR, meeting the expectations of industry (i.e. shipbuilders and shipowners) and flag Administrations, is developed. In order to meet these expectations the new UR shall ensure that all survey items contained in individual Members' Rules and the relevant statutory requirements are covered.

2. Background

The form A also provided a background which is repeated below.

To further develop and complete the draft UR prepared by the AHG/NCSR on requirements for survey of hull structures during ship construction in order to "…..ensure a **more comprehensive** and **more robust** UR **meeting the expectations of Industry**." as requested by IACS Council at C 50, December 2004.

Prior to the first meeting, the group changed from a 'working' to an 'expert' group and received a directive to report direct to Council and not the GPG.

3. Discussion

The EG held two meetings on 20th to 22nd July and 15th and 16th September 2005. The EG was aware of the tight scheduled and the members have endeavoured to stay within it.

The group has once more, progressed the work by consensus.

C51 was held just prior to the first meeting of the EG. The relevant draft minutes of C51 concerning surveyor manning changed prior to final release. The EG therefore agreed that the subject should not be included in to the UR until Council gave a clearer directive.

The EG had the advantage that the majority of the members had worked together on the previous 'ad hoc' group – KR, DNV and BV provided new members for the EG.

The EG has progressed by developing the draft UR submitted in November 2004.

The major differences between the first and second URs which have been submitted are as follows:

Definitions and applications are now in separate sections.

The EG agreed there were four factors to demonstrate consistency of surveys,

> Comments on qualification and monitoring of personnel were expanded, inspectors are used by classification societies for repetitive survey work. The EG propose to Council that consideration should be given to acknowledge the training/education requirements for inspectors. A comment has also been raised concerning the use of seconded surveyors, and it is proposed that this can be dealt with in the future.
>
> In addition to the section on 'survey of hull structure', three new sections have been added:
>
> > Assessment of the shipyard's construction facility
> >
> > Newbuilding survey planning
> >
> > Examination and test plan for newbuilding activities

The table of surveyable items referred to in 'survey of hull structure' has been developed with the aim to satisfy the work instruction of the Form A:

"specific lists and definition of appropriate evidence to be prepared and given to the surveyor"

The document for the assessment of the shipyard's construction facilities is based upon NK's procedure and remains to be completed, the draft, shown as an appendix, however, indicates the thinking of the EG.

Concerning newbuilding survey planning, comments have been raised to be more specific about defining the use of sub-contractors, e.g. for NDE. The use of NDE sub-contractors has been an issue raised by the original ad hoc group as well as the Eg and consideration needs to be reviewing them further in the future.

Concerning the proof of consistency of construction surveys. Members have expressed concern about survey documents being provided to third parties during the course of an audit. It is the intention of this UR that any audits are carried out by responsible bodies empowered by law, convention or IACS.

Concerning the Ship Construction File, the EG would propose that documents concerning wastage, diminution and renewal thicknesses should be included in the UR as soon as IACS are able to provide clear guidelines on requirements, Council comment would be appreciated on this subject. Further consideration is needed by the EG to propose who should check and verify the contents of the ship construction file, if it becomes a classification item then it could become an issue to withhold the classification certification at delivery. This needs to be discussed further.

The original 'Ad Hoc' group raised some queries in the first submission in 2004, these are repeated below and Council comment would be appreciated.

The treatment of sub-contract NDE operators in the shipyards.
The non-uniform application of UR S14

References to UR S6 in Recommendation 20 are not consistent

A comment concerning health, safety and the environment has been included in the UR, it was agreed by the EG that any further reference to the subject should be made in other IACS documents.

4. Conclusion

The EG Chairman would be please to provide any clarification, answer any questions or provide any further comment if required.

Finally, on behalf of the members of the EG, thank you for the invitation to work together on this subject, it has been a great pleasure to do so and we all hope that we have been able to make a contribution to the success of IACS and our industry.

J.J. Finch

29/09/2005

5. Council Considerations

In adopting the UR, Council considered that the proposed Forward was inappropriate for the UR but should be retained and recorded in the TB as follows:

The UR on Hull Survey for New Construction:

1.1 is to verify that ships are in accordance with the relevant Rule and Statutory requirements as part of the classification and statutory certification as part of the new building process (i.e. before being put into service for the first time),

1.2 is focused on the hull structure,

1.3 establishes a link between the classification and statutory surveys. It establishes a link with the draft goal based standards being developed at the IMO (78th session MSC 78/6/2 5 February 2004),

1.4 aims to ensure clear, comprehensive and consistent application of classification rules and statutory requirements at the shipyards and their sub-contractors,

1.5 gives guidance on the specific requirements involved in the construction of the ship to support the surveyors,

1.6 assumes delegation of authority for the flag state is a prerequisite to verification of Statutory Regulations by the classification society as indicated herein,

1.7 assumes that compliance with this UR does not remove the responsibility from the shipbuilder which is to ensure and demonstrate that a satisfactory level of quality has been achieved,

1.8 assumes that the shipbuilder should bring to the attention of the classification society any deviations from the rules and statutory requirements found during construction.

1.9 assumes that shipbuilder has the primary contractual responsibility to ensure that ships are built to meet the functional requirements and safety objectives of the draft goal based standards and that it is the role of the classification society to verify this through survey.

1.10 assumes that hhealth, safety and environment protection measures during new building survey should be provided by the shipbuilder in accordance with the classification societies' requirements.

6. <u>Council 52 Consideration (13-15 Dec.2005)</u>

Concerning the 2nd sentence of paragraph 9.2, Council discussed its impact and decided to delete it because it was a negative proposal which should not be broadcast.

> 9.2 For audit purposes, the ~~actions and~~ information specified in 9.1 is to be made available. ~~Evidence of other surveyors' activities such as patrolling or review of documents other than those specified in 9.1 need not be provided~~.

***

TECHNICAL BACKGROUND

UR Z23 (Rev.2, April 2009)

January 2009 Update to "(Post - External Review of the draft UR Z23) TB, July 2006":

1 The comments raised by the QC after their Auditability Review in Feb. 2008 were generally accepted by the EG and Z23 was updated to reflect the comments.

2 Paragraph 6 – Review of the Construction Facility was amended to further clarify and confirm the purpose of the review.

3 The requirements for the timing and requirements for New Building Survey Planning for series vessels were clarified.

4 There was discussion around the requirements for the supply of information for the Ship Construction File given in Table 1 of the UR when the SCF was not yet a mandatory requirement of Goal Based Standards.

   a. It was agreed that the information on the Hull Construction required by this UR for inclusion in the Ship Construction File should be reviewed for content and confirmed that it has been placed on board.

5 Table 1 was updated to include a reference to the requirements for PSPC in accordance with the instructions from GPG.

6 It was agreed by the EG that Appendix 1 was included as an example of the form but that each Society would make their own Review Record.

7 There were various minor editorial corrections to clarify the text throughout.

Submitted by EG/NCSR Chairman
27 February 2009

Permanent Secretariat note (April 2009):
Rev.2 of UR Z23 was approved by GPG, with an implementation date of 1st July 2010, on 14 April 2009 (ref. 9529_IGd) together with new UIs SC234, LL76 and MPC96 covering 'Initial Statutory Surveys at New Construction'.

Technical Background Document
UR Z23, Rev. 3 (June 2013)

1. Scope and objectives

To revise UR Z23 taking into account the IMO Ship Construction File (SCF) Guidelines and relevant requirements of the GBS Guidelines related to design transparency and construction surveys.

2. Engineering background for technical basis and rationale

- Survey Panel reviewed the IMO documents with respect to the key words 'Ship Construction File (SCF)', 'Construction Survey' and 'Design Surveys' in order to ensure the consistency of URZ23 with the IMO GBS standards and Guidelines.

- Existing UR Z23 has been revised by including a new appendix (Appendix2) for goal based ship construction standards for bulk carriers and oil tanker in order to comply with IMO requirements for design transparency, ship construction file , construction surveys mentioned in IMO Res.MSC.287 (87), IMO Res.MSC.296 (87),IMO Res.MSC.290(87) and MSC.1 /Circ. 1343.

3. Source/derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

Para 1 of "Appendix2" has provisions as per the IMO GBS requirements regarding examination and test plan for new building activities.

The design transparency requirement of IMO Res.MSC.287 (87) and IMO Res.MSC.296 (87) has been included in Para 2 of "Appendix2".

Para 3 of newly added "Appendix 2" is related to the IMO requirements of Ship Construction File (SCF) which requires that any alternatives to the rules, structural details and equivalency calculations to be included to SCF. It also requires that the SCF shall be maintained and updated throughout the ship's life at any major event, including, but not limited to, major repair, conversion/modification of ship structure in order to facilitate safe operation, maintenance, survey, repair and emergency measures.

5. Points of discussions or possible discussions

None

6. Attachments if any

None

Technical Background for UR Z23 Rev.4, Mar 2014

1. Scope and objectives

Review the comments made by industry (INTERTANKO, BIMCO)

2. Engineering background for technical basis and rationale

Panel reviewed the feasibility to the proposals received from Industry (INTERTANKO, BIMCO). Panel found some of the comments did not fall under the responsibility of class surveyors and not within the scope of UR Z23. Thus Panel did not include these proposals to the present revision of UR Z23.

3. Source/derivation of the proposed IACS Resolution

None

4. Summary of Changes intended for the revised Resolution

Following changes are made to UR Z23:

a) Sec. 2.3.3: Term ‘ or equivalent’ deleted from the text.
b) Sec.7: This section modified based on the comments made by industry. Term “series ship production” was introduced.
c) Table 1, Hull Surveyable Items Activities Table, Item 7.1 (Application of Protective Coatings for Dedicated Seawater Ballast Tanks in all Types of Ships and Double-Side Skin Spaces of Bulk Carriers subject to PSPC) - Documentation available to classification surveyor during construction – Coating Standard revised to Signed and Verified Tripartite Agreement.

5. Points of discussions or possible discussions

None

6. Attachments if any

Technical Background (TB) document for UR Z17 (Rev.15 Oct 2020) and UR Z23 (Rev.7 Oct 2020) and UR Z28 (New Oct 2020)

1. Scope and objectives

For addressing the complicated and arduous activities associated with the class inspections required for assuring the integrity of the pressure rated multi-cable transit (MCT) systems installed onboard ships or mobile offshore units (MOUs) from the time of their construction till the end of the ship's life, IACS took the decision:

- to develop new unified requirements on the survey of MCT systems, to be included in URs Z23, Z7 and Z15, based on the use of approved service suppliers to conduct the inspections of MCT systems; and consequently,

- to develop the relevant criteria for the certification of these service suppliers, to be included in UR Z17.

2. Engineering background for technical basis and rationale

IACS Survey Panel, based on the information provided by various MCT system OEMs to the specific Project Team (PT) established for this task, identified the following items to be considered for drafting the survey requirements:

A. conduct regular inspections to assure good condition of MCT systems, identify possible problems and address repairs in a timely manner;

B. assure the traceability and product document for MCT systems through their lifecycle;

C. apply easy to use technologies (digitization, RFID etc.) to store MCT system condition information*;*

D. utilize external specialists to perform inspections and to supplement Surveyor’s efforts;

E. analyze repair-data to identify trouble-prone components or systems for proactive attention;

F. standardize inspection and test methods in accordance with OEM recommendations.

IACS Survey Panel acknowledged the following added values in the use of external specialists for the inspection of MCT system and in the adoption of a MCT system register:

A. a means to uniformly carry out the inspection of MCT system across all the class societies;

B. an expert focus on an acknowledged weak-point of bulkhead integrity through the life cycle of a vessel or marine asset;

C. a system by which MCT systems installation can be tracked throughout their life cycle.

3. Source/derivation of the proposed IACS Resolution

A. Industry feedback originating from known casualties and repetitive incidents of poorly installed and maintained equipment.

B. OEM best practices and standards for installation and maintenance.

C. OEM methodologies for documenting and tracking changes, disruptions, repairs or maintenance of MCT system installations.

4. Summary of Changes intended for the revised Resolution:

Changes to Z23 will include new requirements which mandate the adoption of a Multi Cable Transit Seal Systems Register.

The Register, in hard copy or digitized media, will require any MCT system installation to be documented at time of ship's construction. The Register will include a marking / identification system, documentation referencing manufacturer manual(s) for each type of cable transit installed, the Type Approval certification for each type of transit system, applicable installation drawings, and a recording of each installed transit documenting the as built condition after final shipbuilder inspection in the shipyard.

The Register will also include sections to record any inspection, modification, repair and maintenance.

A recommendatory sample Cable Transit Seal System Register will be included in UR Z23 as an attachment.

A new item 8.6 is to be newly inserted into the Table 1 of UR Z23.

Subsequently, a new URZ will be developed in order that the Register will serve as an on board document maintained to track inspections, modifications and repairs and ensure such activities are properly performed by qualified personnel. The Register will also provide the Class Society Surveyor with a tool to improve the effectiveness of periodic inspections on marine vessels at the time of annual and special surveys.

In view of the above, UR Z17 will be revised to include the requirements for the approval of a new category of service suppliers for the inspection of Cable Transit Seal Systems, who will be tasked to verify MCT systems installation. This will assist to promote adherence to proper installation and maintenance procedures.

A new section 17 will be inserted in UR Z17.

5. Points of discussions or possible discussions

5.1 Survey Panel concurred with the view that the fire rated MCT systems and the pipe penetrations should not be considered under this topic, since this task was specifically dealing with Watertight Cable Transits as proposed by the member initiating this issue.

5.2 Survey Panel and PT agreed to define in the Ship Construction File of UR Z23 a document 'Cable Transit Seal System Register' to record the details of watertight cable transits of a ship installed while under construction and throughout its life, including sections to record any inspection, modification, repair and maintenance.

5.3 Survey Panel concurred with the view that criteria should be established to support electronic formatting of the 'Cable Transit Seal System Register', which is the most operationally effective path to assist owners with installation, inspection, maintenance, and repairs throughout the MCT lifecycle, and agreed to include the recommendatory sample of the Cable Transit Seal Systems Register prepared by PT as Appendix 3 of UR Z23.

5.4 Survey Panel agreed to insert a new hull inspection item 8.6 for Watertight Cable Transit Seal System into Table 1 of UR Z23. When discussing whether to enter in the 'Survey Requirements for Classification' with "tightness", some members were of the view that after installation a leak test may be carried out but it is hard to check the actual watertightness of the CTSS, while the other members preferred to testing the watertightness of the CTSS after installation, and finally the panel agreed to leave the requirements of testing of the watertightness of CTSS to be decided by each society individually.

5.5 Survey Panel and PT deemed it necessary to use approved service suppliers to conduct inspections to the MCT/Transit systems, and developed the Section 17 of UR Z17 for the approval of the service suppliers engaged only in the inspections of Cable Transit Seal Systems, with a view that it will be impractical to use an approved service supplier every time for installing or maintaining the Multi Cable Seal Systems, such as when renewing a single cable.

5.6 Provisions for authorization were included in paragraph 17.2.3 of UR Z17 to allow for cases where the transit system OEM is no longer in business or does not provide technical support.

5.7 In paragraph 17.2.1 of UR Z17, it was agreed to include the contents to approve manufacturers or shipyards equally when they are acting as Service Suppliers.

5.8 Other than revising UR Z7 and UR Z15 for the survey requirements of CTSS for ships in service, Survey Panel agreed to develop a new UR Z28 applicable to all vessels and Mobile Offshore Units (MOUs) contracted for construction on or after 1st July 2021, in addition to the requirements of URs Z23, Z7 and Z15.

5.9 Survey Panel agreed to insert item 1.3 to UR Z28, and apply the survey requirement of item 8.6, Table 1 of UR Z23 to MOUs.

5.10 For the paragraph 4.1.3 of UR Z28, one Survey Panel member was of the view that the approved service supplier should also be permitted to undertake inspection of any disruption to the cable transits or installation of new cable transits, otherwise the use of having an approved service supplier is significantly reduced, while the other members supported to confirm those situations by the attending surveyor, and thus the wording "by the attending surveyor" is retained.

UR Z24 "Survey Requirements for Shell and Inner Doors of Ro-Ro ships"

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Corr.1 (July 2011)	15 July 2011	1 January 2012
New (Nov 2010)	16 Nov 2010	1 January 2012

- ### Corr.1 (July 2011)

.1 Origin of Change:

☑ Suggestion by IACS member

.2 Main Reason for Change:

To revise the definition of the Ro-Ro ship as defined in 2.1 of UR Z24 because some Ro-Ro ships are not fitted with a loading ramp, but rather utilize a shore-based ramp since these vessels are on a common trade route.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

The matter was discussed by Survey Panel under PSU 11015 and all members agreed with the revised wordings of Ro-Ro ships. Panel also agreed to consider this revision as a correction with the same implementation date of 1 January 2012.

.5 Other Resolutions Changes

None

.6 Dates:

Original Proposal: *June 2011*
Panel Approval: *28 June 2011 by: Survey Panel*
GPG Approval: *15 July 2011 (Ref: 11112_IGc)*

- ### New (Nov 2010)

.1 Origin of Change:

☑ Other (The new unified requirement UR Z24 was developed based on the Internal Guideline No. 8 which therefore became obsolete)

.2 Main Reason for Change:

N/A

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

N/A

.5 Other Resolutions Changes

None

Note: There is no separate Technical Background (TB) document for Corr.1 (July 2011).

Technical Background for UR Z24 New, Nov 2010

1. Scope and objectives

The Project Team was instructed to review IACS IG8 to determine whether the IG8 should be changed to a new UR or is to be implemented into UR Z7. The Project Team decided to develop a new UR Z24 Survey Requirements for Shell and Inner Doors of Ro-Ro ships.

2. Engineering background for technical basis and rationale

N/A

3. Source / derivation of the proposed IACS Resolution

The new UR Z24 is based on the previous IG8.

4. Summary of Changes intended for the revised Resolution:

N/A – new unified requirement

5. Points of discussions or possible discussions

During a meeting in Hamburg in September 2007, the Project Team drafted a new UR Z24 Survey Requirements for Shell and Inner Doors of Ro-Ro ships. Further comments were discussed through correspondence and sketches added to the UR. This version was forwarded to the Panel for final decisions at the Spring meeting in March 2008 in Daejeon, Korea.

Point 3.3.3 of the new UR concerning the minimum thickness of hinging arms, securing, supporting and locking devices was forwarded to the Hull Panel and finally agreed upon in May 2010.

6. Attachments if any

None

UR Z25 “Periodic Survey of Fuel Installations on Ships other than Liquefied Gas Carriers utilizing gas or other low flash point fuels”

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Rev.1 (Sep 2017)	12 September 2017	01 January 2019
New (Jan 2017)	23 January 2017	01 January 2018

- **Rev.1 (Sep 2017)**

.1 Origin for Change:

☑ Other (Suggestion by IACS Representative of IMO CG on HSSC survey guidelines)

.2 Main Reason for Change:

During discussions about the HSSC survey items relevant to IGF Code drafted by IMO CG on HSSC survey guidelines with the reference to IACS UR Z25, the IACS Representative of the correspondence group proposed revisions to IACS UR Z25 on the requirements about randomly selected internal examinations and tests to PRVs of gas fuel bunker lines.

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None.

.4 History of Decisions Made:

During discussions about the HSSC survey items relevant to IGF Code drafted by IMO CG on HSSC survey guidelines with the reference to paragraph 2.2.4.ii) of IACS UR Z25, the IACS Representative of the correspondence group proposed revisions to IACS UR Z25 on the requirements about randomly selected internal examinations and tests to PRVs of gas fuel bunker lines.

Survey Panel members agreed that all PRVs should be opened for internal examination and testing within the 5 year survey cycle, and the random selections of the valves to be internally examined and tested at the time of renewal survey should be only applicable to the PRVs which are overhauled and tested between the previous and the present renewal surveys.

The revisions to paragraph 2.2.4.ii) of IACS UR Z25 were agreed by Survey Panel.

No technical background is expected.

.5 Other Resolutions Changes

None.

.6 Dates:

Original Proposal: 6 June 2017 Made by: IACS Representative of IMO CG on HSSC survey guidelines
Panel Approval: 23 August 2017 (Ref: PSU16045a)
GPG Approval: 12 September 2017 (Ref: 16095f_IGg)

- **New (Jan 2017)**

.1 Origin for Change:

☑ Suggestion by IACS member

.2 Main Reason for Change:

During discussions at the September 2015 Survey Panel Meeting, the members supported developing common survey requirements for gas fuelled ships considering the implementation of the IGF Code on ships constructed on or after 1 January 2017.

.3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None.

.4 History of Decisions Made:

The Survey Panel formed a Project Team to review the IGF Code to develop periodical survey requirements for the gas fuel systems. The Form A and Form 1 were approved by GPG on 10 February 2016. The project team held a workshop in Genoa on 14 March 2016 to develop the draft UR which was progressed through correspondence. During the development of the draft UR, it was decided to also include ships utilizing other low flashpoint fuels. The project team submitted a draft UR to the Survey Panel on 29 June 2016 for their approval. The Survey Panel raised comments which were sent to the project team for consideration on 9 August 2016. The project reviewed the comments and submitted a revised draft UR to the Survey Panel on 31 August 2016. The draft UR was discussed and finalized at the Survey Panel Meeting held 7 – 9 September.

No technical background is expected.

.5 Other Resolutions Changes

None.

.6 Dates:

Original Proposal: 17 September 2015 Made by: IACS Member
Panel Approval: 09 September 2016 (Ref: PSU15009)
GPG Approval: 23 January 2017 (Ref: 16003_IGg)

Part B. Technical Background

Note:

1) There are no separate Technical Background (TB) documents for New (Jan 2017) and Rev.1 (Sep 2017).

UR Z26 “Alternative Certification Scheme (ACS)”

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
New (Feb 2015)	27 February 2015	1 July 2016

- **New (Feb 2015)**

.1 Origin for Change:

☒ Request by non-IACS entity (AHG CMC)
☒ Suggestion by IACS members
☒ Based on Other Standards [IACS members’ current rule related alternative certification scheme, EN 10204(2004) and ISO 10474 (1991)]

.2 Main Reason for Change:

An individual certification scheme and an alternative certification scheme are the two current certification procedures for both engines and parts. The existing IACS URs addressing machinery inspection and certification were solely focused on individual certification. The two currently operated schemes need to be reviewed in light of possible alternative certification schemes as proposed by AHG CMC, and an update and/or revision of the current certification procedures for both engines and parts.

.3 List of non-IACS Member classification societies contributing through the TC Forum and/or participating in IACS Working Group:

None

.4 History of Decisions Made:

It was decided at the kick-off meeting (held in 24 – 25 April 2008) of the Project Team that ACS, which could be used parallel to traditional approaches, should be developed based on the members’ current ACS requirements. The draft of the ACS was developed by the PT and submitted to the 12th Machinery Panel meeting for its review. The draft was finalized at the 15th Machinery Panel meeting.

The agreed version, finalized in the 16th panel meeting, was submitted to the Survey Panel for their agreement and/or comments. In addition we requested the Survey Panel to agree to issue the UR as a Z.

The Survey Panel agreed to issue the UR as Z and gave 3 comments which have been handled in the Machinery Panel.

The Panel, at the 12th meeting, agreed that the ACS be developed solely for the engine products, without considering the mutual recognition concept.
However, at the 15th Panel meeting, the majority agreed not to limit the scope of the ACS to machinery only, with at least two Societies proposing to limit the scope to engine products only.

The Survey Panel had 3 comments to the draft UR which was subject to the Machinery Panel review.

.5 Other Resolutions Changes

UR M14 and M5 are to be deleted.

.6 Dates:

Panel Approval: 08 January 2015 (By: IACS Machinery Panel)
GPG Approval: 27 February 2015 (Ref: 7569_IGw)

Part B. Technical Background

List of Technical Background (TB) documents of UR Z26:

Annex 1. **TB for New (Feb 2015)**

See separate TB document in Annex 1.

◄▼►

Technical Background (TB) document for UR Z26 (New Feb 2015)

1. Objective and background.

The existing IACS requirements for machinery have inspection by the Surveyor as the sole option for survey in connection with certification for class.
ISO and EN standards, however, offer several other options. In spite of the fact that IACS requirements do not prescribe ways to take advantage of Quality Systems, some Societies have been practicing alternative certification schemes for several years.
In connection with the revision of 10 UR-Ms, the Project Team (PT3 consisting of 7 members) considered that the unification of alternative certification schemes was necessary.

2. Methodology of Work.

A draft of the UR was put together from existing rules from those Societies having implemented alternative certification schemes. The other members added improving comments to the draft.

3.Engineering background

The ACS complements traditional certification schemes as required by a Society's rules. Under the ACS a Surveyor need not be present at all inspections and testing.

4. Points of discussion or possible discussions

There was no significant dispute about the contents of the draft.

At the 16th meeting, and due to comments from societies, the draft was subject to thorough examination:

Main changes:
The definition has been changed to remove "agreement" as not all societies make an agreement.
The definition of certificate type was moved to M72 as an ACS is limited to the Society Certificate.
A general tidying up of the content was also made.

The comments from the Survey Panel were circulated in the Machinery Panel and discussed at the 17th meeting.

It was agreed not to add the proposed definition: "For the purposes of ACS; Conformity Assessment, Unit Certification and Factory Acceptance Testing will be synonymous terms" as the ACS regards equipment and systems requiring Society Certificate only.
It was agreed to include specific items on current drawings and Rules and standards.
It was agreed to delete the "issuing the Society Certificate" and include "e.g. declaration of conformity".

5. Attachments if any

None

UR Z27 "Condition Monitoring and Condition Based Maintenance"

Summary:

IACS developed this new unified requirement for the approved Condition Monitoring and Condition Based Maintenance schemes applying to machinery components and systems where condition monitoring results are used to influence the scope and/or frequency of Class survey, including the requirements of software, onboard working, documentation, personnel, approval and survey for applying the scheme, and survey/audit for maintenance of the scheme.

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
New (July 2018)	12 July 2018	1 January 2020

- **New (July 2018)**

1 Origin of Change:

☑ Suggestion by IACS members

2 Main Reason for Change:

To address the FUA 11 of C73, raised by the Council of the IACS in respect to the future work directions on the implications of new technology on Remote Monitoring/ Diagnosis (RMD) and Condition Based Inspecting/Maintenance (CBM). Survey Panel discussed the issue and agreed to establish a PT to provide suggestions for the possible revisions of the relevant IACS Resolutions and Recommendations (e.g. UR Z18, UR Z20, Rec.74) and the draft of new Recommendations/Guidelines which may help the concrete application of these technologies.

3 List of non-IACS Member Classification Societies contributing through the TC Forum and/or participating in IACS Working Group:

None

4 History of Decisions Made:

Survey panel discussed this issue under Panel task PSU16057 allocated by GPG on 21th October 2016. The subject deals with the review of the UR and Recommendation under Panel responsibility in order to determine whether a revision could need in order to consider the new technologies on Remote Monitoring/Diagnosis (RMD) and Condition Based Inspecting/Maintenance (CBM).

In this respect the Survey Panel discussed the topics and agreed that a PT dealing with the matters would be advisable in order to provide suggestions for the possible revisions of the relevant IACS Resolutions and Recommendations (e.g. UR Z18, UR

Z20, Rec 74) and the draft of new Recommendations/Guidelines which may help the concrete application of these technologies.

PT PSU34/2017 was established, and newly drafted the UR Z27 "Condition Monitoring and Condition Based Maintenance"

During the 26th Survey Panel meeting, panel members concurred with comments on PT's submission and proposed actions were taken by the PT. Survey Panel reviewed the drafts which was further amended and agreed by Survey Panel. Finally, the qualified majority of the Panel Members agreed the draft text of the UR Z27 and modifications to UR Z18, UR Z20 and Recommendation 74.

Refer TB Document in Annex 1.

5 Other Resolutions Changes:

UR Z18, UR Z20

6 Dates:

Original Proposal	: 21 October 2016 assigned by GPG
Panel Approval	: 15 June 2018 by Survey Panel (Ref: PSU16057)
GPG Approval	: 12 July 2018 (Ref: 18076_IGd)

Part B. Technical Background

List of Technical Background (TB) documents for UR Z27:

Annex 1. **TB for New (July 2018)**

See separate TB document in Annex 1

◄▼►

Technical Background (TB) document for UR Z27 (New July 2018)

1. Scope and objectives

Upon the investigations of new technologies' implications on survey regime, IACS developed this unified requirement to the approved Condition Monitoring and Condition Based Maintenance schemes applying to the machinery components and systems where the condition monitoring results are used to influence the scope and/or frequency of Class survey, including the requirements of software, onboard working, documentation, personnel, approval and survey for applying the scheme, and survey/audit for maintenance of the scheme.

2. Engineering background for technical basis and rationale

As far as the PT members have been able to conclude, the CBM is a set of maintenance actions based on real-time or near-real time assessment of equipment condition which is obtained from embedded sensors and/or external tests & measurements taken by portable equipment. From a Classification Society's consideration, the RMD embraces similar principles of monitoring. Apart of CBM and RMD there exist various systems of monitoring based on acquisition and processing of information and data that indicate the state of a machine over time. With emerging technologies such as Radio Frequency IDentification (RFID), various sensors, Micro-Electro-Mechanical System (MEMS), wireless tele-communication, Supervisory Control and Data Acquisition (SCADA) and Product Embedded Information Devices (PEID) there are expected to be rapidly used in the world such systems for gathering and monitoring the status of components. Moreover, the CBM scheme in general can be treated as a method used to reduce the uncertainty of maintenance activities and embraces various condition monitoring/diagnosis technologies and techniques such as lubricant/fuel, wear particle, bearing temperature, infrared thermography and motor current signature analysis.

Having recognized that, the PT agreed the subsequent Guidelines shall not be limited only by CBM and RMD systems and decided to leave opportunity for implementation existing and forthcoming systems based on the principals of the condition monitoring/diagnosing intrinsic to the CBM.

3. Source / derivation of the proposed IACS Resolution

The PT reviewed the current IACS Resolutions and Recommendations and detected paragraphs potentially impacted.

4. Summary of Changes intended for the revised Resolution:

The PT prepared a draft of a new document UR Z27 covering Condition Monitoring and Condition Based Maintenance schemes where the condition monitoring results are used to influence the scope and/or frequency of Class survey. Besides, the PT proposed a draft of corrigenda to the UR Z18, UR Z20 and Recommendation 74.

5. Points of discussions or possible discussions

The task was triggered by GPG to review and set the future work directions on the implications of new technology on survey regime, in relation with other technologies, especially the Remote Monitoring/Diagnosis (RMD) and the Condition Based Inspecting/Maintenance (CBM). A project team was agreed to be established, and the Form A and Form 1 were agreed by GPG on 24/03/2017.

PT manager submitted the PT outcomes to the Survey Panel meeting on 25/08/2017, and some comments were got from panel members before the 26th panel meeting.

During the 26th Survey Panel meeting, a Member introduced their comments and indicated that as a minimum requirement, the related UR shall include the minimum parameters to be checked in order to monitor the condition of the various machinery for which this type of maintenance is accepted; The panel agreed with the view of a Member that for ease of understanding and implementation, revisions should be made in UR Z20 only, to include the elements of the proposed new UR instead of having two separate URs.

The PT suggested:

- that elaborating on requirements would likely to limit UR’s applicability for ensuing technologies, thus no changes are required.

- to steer a course of action had been embarked on during the team joint work and be committed to have a separate UR Z27 instead of merging the requirements with UR Z20.

Based on preceding discussion it was concluded that qualified majority of the Panel Members agreed with PT's opinion that a separate UR for CM/CBM as designed by PT was the appropriate course of action.

PT, after examination of the Panel’s comments, prepared

- a new version of the draft UR addressing the comments and suggestions, and

- the technical justifications/explanations.

On October 2017 PT sent to the Panel the new version of the draft.

Finally, the qualified majority of the Panel Members agreed the draft text of the UR Z27 and modifications to UR Z18, UR Z20 and Recommendation 74.

6. Attachments if any

UR Z28 “Surveys of Watertight Cable Transits”

Summary

This modification is to correct reference in para. 2.1.1

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
Corr.1 (June 2021)	30 June 2021	-
New (Oct 2020)	02 October 2020	1 July 2021

- **Corr.1 (June 2021)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

This modification is to correct a reference in para.2.1.1.

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

4 History of Decisions Made:

A member of the Survey Panel found one wrong reference in para.2.1.1. Para.2.2.1 gives an example of record “Recommendatory Sample – Cable Transit Seal System register” as appendix 1. However, the appendix 1 is not attached in UR Z28. Survey Panel discussed about it and concluded to put a reference to appendix 3 of UR Z23 rather than to attach the same record into UR Z28.

5 Other Resolutions Changes:

None

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal: 17 March 2021 Made by A Survey Panel Member
Panel Approval: 21 June 2021 (Ref: PSU21011)
GPG Approval: 30 June 2021 (Ref: 16222aIGb)

- **New (Oct 2020)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

A global unified standard is required to improve the installation and maintenance of Pressure-Rated MCT/Transit systems. In order to properly maintain Ship and Mobile Offshore Unit structures and promote vessel safety during water ingress a better method is necessary to document and manage installation, maintenance, and repair of MCT/Transit systems. By improving documentation during initial installation, incorporating the installation information into a systemized maintenance plan, and using knowledgeable authorized/approved service entities to conduct inspections and manage repairs or alterations, the risks of MCT failures will be reduced. This will mitigate potential safety and environmental incidents as a result of service oversights and exposure to onboard flooding damage conditions.

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

None

4 History of Decisions Made:

A member of the Survey Panel raised the issue of survey requirements during the 24th Survey Panel Meeting. In detail under discussion is the concept for the preparation of an IACS tool (a Recommendation or an UR, whichever deemed more appropriate) which addresses the complicated and arduous activities associated with the particular inspections required for class to accept the continuous integrity of the multi cable transit from the time of their installation till to the end of the ship's life.

In this respect the Survey Panel discussed the topics and agreed that a PT dealing with the matters would be advisable in order to provide suggestions for the possible revisions of the relevant IACS Resolutions (e.g. Z23, Z7, Z15, and Z17)

PT PSU32/2017 was established, and made revisions to the UR Z23, Z7 and Z17.

PT’s proposal was submitted to the Survey Panel on 11 August 2017, panel members concurred with comments on PT’s submission and proposed actions were taken by the PT. Survey Panel reviewed the drafts which was further amended and agreed by Survey Panel on 14 March 2019 during the 29th Panel Meeting.

Realizing that the UR for approval of Service Suppliers for the inspection of Cable Transits is newly developed by IACS, before enough Service Suppliers being approved, it might be premature to push out the UR for the inspections to the cable transits of ships in service, the members agreed to push out the IACS URs step by step, and firstly to work out the revision to UR Z23 to include the requirement of the “Register” for new construction ships, and the revision to UR Z17 for the details of the approval requirements of the Service Suppliers for the inspection of Cable Transits, and secondly to complete the draft of the new URZ (other than revising URs Z7 and Z15) in a later time with all the survey requirements to the cable transits, leaving the mandatory requirements for the service supplier to be considered in the future.

As proposed by one member, Survey Panel further considered to insert a new hull inspection item of Watertight Cable Transit Seal System into Table 1 of UR Z23, and agreed to insert a new item 8.6 for this purpose. During the 30th Survey Panel meeting, the panel finalized the contents of item 8.6 of Table 1 of UR Z23.

After the 30th Survey Panel meeting, the panel finalized the new UR Z28 and the revisions to URs Z23 and Z17.

Refer TB Document in Annex 1 of Part B.

5 Other Resolutions Changes:

URs Z17, Z23

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal:	29 September 2016 Made by A Survey Panel Member
Panel Approval:	21 September 2020 (Ref: 16222_PYg)
GPG Approval:	02 October 2020 (Ref: 16222_IGv)

Part B. Technical Background

List of Technical Background (TB) documents for UR Z28:

Annex 1. **TB for New (Oct 2020)**

See separate TB document in Annex 1.

◄▼►

Note: *There are no separate Technical Background (TB) documents for Corr.1 (June 2021).*

Technical Background (TB) document for UR Z17 (Rev.15 Oct 2020) and UR Z23 (Rev.7 Oct 2020) and UR Z28 (New Oct 2020)

1. Scope and objectives

For addressing the complicated and arduous activities associated with the class inspections required for assuring the integrity of the pressure rated multi-cable transit (MCT) systems installed onboard ships or mobile offshore units (MOUs) from the time of their construction till the end of the ship's life, IACS took the decision:

- to develop new unified requirements on the survey of MCT systems, to be included in URs Z23, Z7 and Z15, based on the use of approved service suppliers to conduct the inspections of MCT systems; and consequently,

- to develop the relevant criteria for the certification of these service suppliers, to be included in UR Z17.

2. Engineering background for technical basis and rationale

IACS Survey Panel, based on the information provided by various MCT system OEMs to the specific Project Team (PT) established for this task, identified the following items to be considered for drafting the survey requirements:

A. conduct regular inspections to assure good condition of MCT systems, identify possible problems and address repairs in a timely manner;

B. assure the traceability and product document for MCT systems through their lifecycle;

C. apply easy to use technologies (digitization, RFID etc.) to store MCT system condition information;

D. utilize external specialists to perform inspections and to supplement Surveyor's efforts;

E. analyze repair-data to identify trouble-prone components or systems for proactive attention;

F. standardize inspection and test methods in accordance with OEM recommendations.

IACS Survey Panel acknowledged the following added values in the use of external specialists for the inspection of MCT system and in the adoption of a MCT system register:

A. a means to uniformly carry out the inspection of MCT system across all the class societies;

B. an expert focus on an acknowledged weak-point of bulkhead integrity through the life cycle of a vessel or marine asset;

C. a system by which MCT systems installation can be tracked throughout their life cycle.

3. Source / derivation of the proposed IACS Resolution

A. Industry feedback originating from known casualties and repetitive incidents of poorly installed and maintained equipment.

B. OEM best practices and standards for installation and maintenance.

C. OEM methodologies for documenting and tracking changes, disruptions, repairs or maintenance of MCT system installations.

4. Summary of Changes intended for the revised Resolution:

Changes to Z23 will include new requirements which mandate the adoption of a Multi Cable Transit Seal Systems Register.

The Register, in hard copy or digitized media, will require any MCT system installation to be documented at time of ship's construction. The Register will include a marking / identification system, documentation referencing manufacturer manual(s) for each type of cable transit installed, the Type Approval certification for each type of transit system, applicable installation drawings, and a recording of each installed transit documenting the as built condition after final shipbuilder inspection in the shipyard.

The Register will also include sections to record any inspection, modification, repair and maintenance.

A recommendatory sample Cable Transit Seal System Register will be included in UR Z23 as an attachment.

A new item 8.6 is to be newly inserted into the Table 1 of UR Z23.

Subsequently, a new URZ will be developed in order that the Register will serve as an on board document maintained to track inspections, modifications and repairs and ensure such activities are properly performed by qualified personnel. The Register will also provide the Class Society Surveyor with a tool to improve the effectiveness of periodic inspections on marine vessels at the time of annual and special surveys.

In view of the above, UR Z17 will be revised to include the requirements for the approval of a new category of service suppliers for the inspection of Cable Transit Seal Systems, who will be tasked to verify MCT systems installation. This will assist to promote adherence to proper installation and maintenance procedures.

A new section 17 will be inserted in UR Z17.

5. Points of discussions or possible discussions

5.1 Survey Panel concurred with the view that the fire rated MCT systems and the pipe penetrations should not be considered under this topic, since this task was specifically dealing with Watertight Cable Transits as proposed by the member initiating this issue.

5.2 Survey Panel and PT agreed to define in the Ship Construction File of UR Z23 a document 'Cable Transit Seal System Register' to record the details of watertight cable transits of a ship installed while under construction and throughout its life, including sections to record any inspection, modification, repair and maintenance.

5.3 Survey Panel concurred with the view that criteria should be established to support electronic formatting of the 'Cable Transit Seal System Register', which is the most operationally effective path to assist owners with installation, inspection, maintenance, and repairs throughout the MCT lifecycle, and agreed to include the recommendatory sample of the Cable Transit Seal Systems Register prepared by PT as Appendix 3 of UR Z23.

5.4 Survey Panel agreed to insert a new hull inspection item 8.6 for Watertight Cable Transit Seal System into Table 1 of UR Z23. When discussing whether to enter in the 'Survey Requirements for Classification' with "tightness", some members were of the view that after installation a leak test may be carried out but it is hard to check the actual watertightness of the CTSS, while the other members preferred to testing the watertightness of the CTSS after installation, and finally the panel agreed to leave the requirements of testing of the watertightness of CTSS to be decided by each society individually.

5.5 Survey Panel and PT deemed it necessary to use approved service suppliers to conduct inspections to the MCT/Transit systems, and developed the Section 17 of UR Z17 for the approval of the service suppliers engaged only in the inspections of Cable Transit Seal Systems, with a view that it will be impractical to use an approved service supplier every time for installing or maintaining the Multi Cable Seal Systems, such as when renewing a single cable.

5.6 Provisions for authorization were included in paragraph 17.2.3 of UR Z17 to allow for cases where the transit system OEM is no longer in business or does not provide technical support.

5.7 In paragraph 17.2.1 of UR Z17, it was agreed to include the contents to approve manufacturers or shipyards equally when they are acting as Service Suppliers.

5.8 Other than revising UR Z7 and UR Z15 for the survey requirements of CTSS for ships in service, Survey Panel agreed to develop a new UR Z28 applicable to all vessels and Mobile Offshore Units (MOUs) contracted for construction on or after 1st July 2021, in addition to the requirements of URs Z23, Z7 and Z15.

5.9 Survey Panel agreed to insert item 1.3 to UR Z28, and apply the survey requirement of item 8.6, Table 1 of UR Z23 to MOUs.

5.10 For the paragraph 4.1.3 of UR Z28, one Survey Panel member was of the view that the approved service supplier should also be permitted to undertake inspection of any disruption to the cable transits or installation of new cable transits, otherwise the use of having an approved service supplier is significantly reduced, while the other members supported to confirm those situations by the attending surveyor, and thus the wording "by the attending surveyor" is retained.

UR Z29 "Remote Classification Surveys"

Summary

This UR Z was newly developed to provide remote classification survey requirements for ships in service.

Part A. Revision History

Version no.	Approval date	Implementation date when applicable
New (Mar 2022)	25 March 2022	1 January 2023

- **New (Mar 2022)**

1 Origin of Change:

☑ Suggestion by IACS member

2 Main Reason for Change:

It was considered essential to develop common requirements for the implementation of remote surveys as an acceptable form of intervention in some circumstances in response to the accelerated challenges to board vessels to do normal attendance surveys due to the Covid-19 situation. Further, increased and progressive adoption of remote surveys beyond the Covid-19 emergency situation is considered unavoidable due to the advanced technology developments and the possibilities of saving costs and time while ensuring the same quality and safety standards.

To ensure all IACS members have uniform guidance and requirements on remote surveys, a new IACS Unified Requirement has been developed with the objective of allowing remote surveys only in case the quality of survey is not compromised, and the survey is carried out with the same assurance as the ones performed by an on board attending surveyor.

3 List of non-IACS Member classification societies contributing or participating in IACS Working Group:

Türk Loydu

4 History of Decisions Made:

IACS Council C81, FUA 14, tasked the Survey Panel to establish a Project Team (PT) to assess the aspect related to the remote surveys, considering the recommendations 11B of SC/Strategy in July 2020. The PT PSU38/2021 (Survey Panel Task PSU 20033) was established in August-2020 and members prepared the Terms of Reference (ToR) / Scope of Work for PT which was approved by the Council. Task project team specification (Form A and Form 1) was prepared and same was agreed by the GPG in January 2021.

The PT acted in accordance with approved scope as per Form A and Form 1 and worked from February 2021 until the end of December 2021. The PT also collected the information from all members on the present status on what and how class societies are doing the remote surveys to get overall overview of scope and current procedure. It was clarified by the GPG that classification surveys during the new construction and statutory system audits are out of scope of this project. PT proposed that final output of the project shall be a new Unified Requirement, rather than a Recommendation, so that common requirements are applied by IACS members upon transposition of the said UR into individual classification rules. The development of such a UR, rather than a Recommendation, should meet the expectations of other stake holders, regulators, and Administrations.

One of the tasks of the PT was to define the 'Remote Survey', 'Remote Inspection' and 'Remote Examination'. The PT drafted the definition of remote survey, however, decided that there is no compelling reason to define 'remote inspection' and 'remote examination'. The commonly agreed terminology within IMO, EU, flag states and IACS is 'remote survey' for classification and statutory works. In addition, 'remote inspection technique' is already described in the IACS Rec 42. Furthermore, the words 'inspection' and 'examination' have been used at various places in the IACS resolutions, IMO Resolution A.1140(31)- survey guidelines under HSSC, ESP code, and RO code with different meanings. If a new definition of remote inspection/ remote examination is proposed now by the IACS, this would affect the referenced documents, which may need to be re-written to be consistent, and it could also conflict with the existing definitions already available in the industry.

The first draft of the UR was submitted by the PT to the Survey Panel on 28 September 2021. The Survey Panel Chair circulated the document through the IACS TC forum with the participation of Türk Loydu (TL) to all members. After the first round, the Survey Panel Chair tasked the PT to review the resulting comments from the TC forum. After reviewing all comments and making relevant changes, the PT submitted the 2nd draft to the Survey Panel Chair for further discussion within the TC forum on 29 October 2021. The 2nd round resulted in additional comments and amendments to the draft UR with comments as follows.

1. It was agreed that the UR should not define the start date of the remote survey.

2. It was agreed that not all digital information is required to be stored.

3. Majority of members expressed that the additional training required for remote surveys shall be in accordance with societies procedure and shall cover additional aspects as per para 2.2.1 of the UR

4. Majority of members expressed that monitoring of remote surveyor shall be carried out in accordance with IACS PR 6.

5. Majority of members agreed that no further clarification was needed to define "minor" items eligible for remote survey as per the table 1 of section 3.1.

6. Majority of members agreed that the UR should not be applicable for the offshore units.

7. Majority of members agreed not to include a formal definition of "place of survey"

Extensive discussions took place at the PT level and within the TC forum regarding the scope of the eligible survey items. The conclusion of this discussion resulted in the table 1 (Eligible remote survey items) of paragraphs 3.1 of proposed UR. Other discussions took place on information and communication technology requirements, qualification & monitoring of surveyors, performance, assessment and reporting of remote surveys.

The pure statutory scope (not covered by class rules) was also discussed during the development of requirements, however not included in the UR which is for classification items only.

While the UR sets the minimum requirements for Classification Remote Surveys, it also clearly requires that when the classification survey is also related to a statutory item, and the Society is carrying out the statutory survey on behalf of the Flag State Administration, then the Flag State Administration acceptance is required, and possible additional requirements are to be complied with.

The PT also reviewed and discussed the submissions made by China, Korea and EU/US at the IMO MSC 104, as well as current existing flag state instructions in that respect.

5 Other Resolutions Changes:

None

6 Any hinderance to MASS, including any other new technologies:

None

7 Dates:

Original Proposal	: 03 July 2020	Made by GPG (Ref: 20110_IGa)
Panel Approval	: 15 February 2022	(Ref: PSU20033_ISUn)
GPG Approval	: 25 March 2022	(Ref: 20110_IGz)

Part B. Technical Background

List of Technical Background (TB) documents for UR Z29:

Annex 1. **TB for New (Mar 2022)**

See separate TB document in Annex 1.

Technical Background (TB) document for UR Z29 (New Mar 2022)

1. Scope and objectives

With increasing remote surveys activities during the pandemic in the year 2020, It was observed that classification societies individually developed their own procedures without common requirements to carry out such remote surveys. To ensure all IACS members have uniform guidance & requirements, IACS initiated a Project Team (PT) under the Survey Panel in the autumn of 2020. The main task of the project was to develop the Unified Requirements or the Recommendations for classification remote surveys for ships in service. The IACS common requirements have been developed with an objective that the Remote Survey will only be appropriate provided the quality is not compromised, and the survey is carried out with the same assurance as the ones performed by an on board attending surveyor.

The project was carried out as per following objectives (refer approved Form 1):

1. Develop the principles to ensure equivalency between remote survey and traditional survey with surveyor attendance,
2. Establish general definition, application scope, conditions and limitations of remote survey, any gaps/requirements in terms of training of personnel,
3. Review existing IACS resolutions to Identify impediments to remote surveys and any inconsistency which may exist in HSSC Guidelines with respect to remote survey (Refer to UR Z1),
4. Consider the development of a UR or Rec.

The following scope was agreed for the project:

1. To collect members' remote survey application, scope, experience and relevant techniques and technology being used, as well as flag requirements on remote survey, as appropriate.
2. To identify and analyse current/potential expectation and concerns of regulators and the industry, such as DG MOVE, AVC, IMO, Flag, Ship-owner, Insurer, etc.
3. To develop the principles to ensure equivalency between remote survey and traditional survey with surveyor attendance, taking into account current and potential technological innovation, quality assurance and for the benefit of sustainable class/industry development.
4. To establish general definition, application scope, conditions and limitations of remote survey, any gaps/requirements in terms of training of personnel, and further distinguish pertinent terms such as "Remote Survey", "Remote Inspection" and "Remote Examination" used by IACS and Industry.
5. To review existing IACS resolutions to identify impediments to remote survey, and further identify any inconsistency which may exist in HSSC Guidelines (refer to UR Z1).
6. To consider the development of a UR or Rec by drafting:
   a) minimum requirements for remote survey in order to confirm equivalency to conducting an onboard survey;
   b) minimum requirements of quality for information communication technologies, including connectivity and speed;
   c) scope and detailed remote survey processes;
   d) requirements for evidence/documentation to be recorded and reported.

2. Engineering background for technical basis and rationale

The work was divided into three phases.

Phase A – Info Gathering - collected information on present status on what and how class societies were doing remote survey

Phase B – Equivalence and Impediments – it covered overarching principles to ensure equivalency between remote survey and traditional onboard survey. The project identified gaps and requirements in terms of training of personnel, and further defined pertinent terms such as 'Remote Survey' used by IACS and the Industry. The existing IACS resolutions were reviewed to identify impediments to remote survey, and further identify any inconsistencies which may exist in HSSC Guidelines with respect to remote survey (UR Z1).

Phase C – Summary Phase – based on findings from Phase A and B, considered the development of a UR for Remote Survey. The UR was developed based on the following main items:

a) Minimum requirements for remote survey in order to confirm equivalency to conducting an onboard survey

b) Minimum requirements of quality for information communication technologies including connectivity and speed

c) Scope and detailed remote survey processes

d) Requirements for evidence/documentation to be recorded and reported.

3. Source/derivation of the proposed IACS Resolution

The proposed UR is not based on any international/national/industry standard. The UR has been developed based on the experiences and procedures developed by the individual classification societies including the experience during the force majeure situation during the COVID-19. Due account was taken to the general policies of flag states and to the principals laid down to the submissions by EU/US, Korea and China.

4. Summary of Changes intended for the revised Resolution:

None

5. Points of discussions or possible discussions

The project's main focus was to develop the common requirements, keeping the principle of equivalency between remote and traditional on board surveys into consideration. Extensive discussions took place at the PT level and within the TC forum regarding the scope of the eligible survey items. The conclusion of this discussion resulted in the table 1 (Eligible remote survey items) of paragraphs 3.1 of proposed UR. Other discussions took place on information and communication technology requirements, qualification & monitoring of surveyors, performance, assessment and reporting of remote surveys.

The PT reviewed and discussed to the submissions made by China, Korea and EU/US at the IMO MSC 104, as well as current existing flag state instructions in that respect.

While the UR sets the minimum requirements for Classification remote surveys, it also clearly requires that when the classification survey is also related to a statutory item, and the Society is carrying out the statutory survey on behalf of the Flag State Administration, then the Flag State Administration acceptance is required, and possible additional requirements are to be complied with.

6. Attachments if any

Appendix – Inconsistency and Impediments to remote survey in the current IACS resolutions

Appendix

Inconsistencies in HSSC Guidelines w.r.t Remote Survey:

No specific inconsistencies in HSSC Guidelines w.r.t remote survey have been noticed. Meantime, interpretation of the terminology of "visual examination" which are used in 4.2.2.2.1 & 2 of HSSC Guidelines – General is to be clarified for applying remote survey, and PT concluded that "visual examination" included remote survey using appropriate communication means such as live-streaming two-way video with audio.

Impediments to remote survey in the IACS resolutions:

Some impediments to remote survey have been noticed in the IACS resolutions as shown in the below table. In various parts of IACS resolutions, the terminologies such as "attended", "attended on board", "be on board", "attendance" and "witnessed" are used and such terminologies, that were normally interpreted as requiring physical attendance/witness (on board), will need to be interpreted in the future as requiring physical or remote attendance/witness.

Scope	PR/UR	Para No.	Regulatory impediment
Extension of special survey	PR1C	A1.1.1	Under "exceptional circumstances", the Society may grant an extension not exceeding three (3) months to allow for completion of the Special Survey provided that the vessel is attended and the attending Surveyor(s)[1] so recommend(s) after the following has been carried out: …
Single voyage to demolition yard	PR1C	A1.6	When a vessel is intended for a demolition voyage with any periodical survey overdue, the vessel's class suspension may be held in abeyance and consideration may be given to allow the vessel to proceed on a single direct ballast voyage from the lay up or final discharge port to the demolition yard. In such cases a short term Class Certificate with conditions for the voyage noted may be issued provided the attending surveyor finds the vessel in satisfactory condition to proceed for the intended voyage.
Safety Radio during change of class without flag change	PR12	5.2.2 b)	Prior to the issuance of a Cargo Ship Safety Radio Certificate, the gaining Society shall carry out a full Renewal Survey (in case of non-HSSC certification) or a full Periodical Survey (in cases of HSSC certification). In cases where the Cargo Ship Safety Radio survey carried out due to change of class is not to be credited as periodical or renewal survey and the service supplier used by the losing Society is acceptable to the gaining Society, the survey may be limited to a

			general verification by the attending surveyor based on the last service report.
Thickness measurement	PR19	1	Thickness Measurements required in the context of hull structural classification surveys, if not carried out by the Society itself shall be witnessed by a surveyor. The attendance of the surveyor shall be recorded.
		2	This requires the surveyor to be on board, while the gaugings are taken, to the extent necessary to control the process (see Footnote).
Relevant special/intermediate survey for certain ESP ships	PR20	2	This requires that at least two exclusive surveyors attend on board at the same time to perform the required survey1). Where compatible with relevant laws and regulations, on dual class vessels, the requirement for two surveyors may be fulfilled by having one surveyor attend from each Society.
Access to structure	UR Z7 Z7.1 Z7.2 Z10.1 Z10.2 Z10.3 Z10.4 Z10.5 Z15	 5.2.1/5.2.2 5.2.1/5.2.2 5.2.1/5.2.2 5.3.1/5.3.2 5.3.1/5.3.2/ 5.3.3/5.3.4 5.3.1/5.3.2 5.3.1/5.3.2 5.3.1/5.3.2 9.2.1/9.2.2	(Example) UR Z7 5.2.1 For survey, means are to be provided to enable the surveyor to examine the hull structure in a safe and practical way. 5.2.2 For survey in cargo holds and ballast tanks, one or more of the following means for access, acceptable to the Surveyor, is to be provided: • permanent staging and passages through structures; • temporary staging and passages through structures; • hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms; • boats or rafts; • other equivalent means.
Close-up survey	UR Z7	1.2.3	A Close-Up Survey is a survey where the details of structural components are within the close visual inspection range of the surveyor i.e. normally within reach of hand.
Thickness measurement and close-up survey using RIT	UR Z7	1.4.2	Consideration may be given by the attending Surveyor to allow use of Remote Inspection Techniques (RIT) as an alternative to close-up survey. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor. When RIT is used for a close-up survey, temporary means of access for the corresponding thickness measurements is to be provided unless such RIT is also able to carry out the required thickness measurements.

Close-up survey using RIT	UR Z7	1.6.3	When using a RIT as an alternative to close-up survey, if not carried out by the Society itself, it is to be conducted by a firm approved as a service supplier according to URZ17 and is to be witnessed by an attending surveyor of the Society.
Examination of bilge/ballast piping systems during special survey	UR Z7	2.2.12	All bilge and ballast piping systems are to be examined and operationally tested to working pressure to attending Surveyor’s satisfaction to ensure that tightness and condition remain satisfactory.
Survey for automatic air pipe heads during special survey	UR Z7	TABLE 4 Note (1)	The selection of air pipe heads to be examined is left to the attending Surveyor.
Close-up survey for general dry cargo	UR Z7.1	1.2.4	A Close-up Survey is a survey where the details of structural components are within the close visual inspection range of the surveyor, i.e. normally within reach of hand.
Thickness measurement and close-up survey using RIT for general dry cargo	UR Z7.1	1.4.2	Consideration may be given by the attending Surveyor to allow use of Remote Inspection Techniques (RIT) as an alternative to close-up survey. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor. When RIT is used for a close-up survey, temporary means of access for the corresponding thickness measurements as specified in this UR is to be provided unless such RIT is also able to carry out the required thickness measurements.
Close-up survey using RIT for general dry cargo	UR Z7.1	1.5.3	When using a RIT as an alternative to close-up survey, if not carried out by the Society itself, it is to be conducted by a firm approved as a service supplier according to UR Z17 and is to be witnessed by an attending surveyor of the Society.
Examination of bilge/ballast piping systems during special survey for general dry cargo	UR Z7.1	2.2.1.3	All piping systems within the above spaces are to be examined and operationally tested to working pressure to attending Surveyor’s satisfaction to ensure that tightness and condition remain satisfactory.
Intermediate survey for general dry cargo over 15 years of age	UR Z7.1	4.2.4.1	The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in 2, except for item 2c) in column 4 of Table II. However, tank testing specified in 2.5, survey of automatic air pipe heads (see Notes in 2.2.1.4 and 2.3.4) and internal examination of fuel oil, lube oil and fresh water tanks (see 2.3.1) are not required unless deemed necessary by the

			attending surveyor.
Thickness measurement for general dry cargo	UR Z7.1	6.1.1	The required thickness measurements, if not carried out by the Society itself, are to be witnessed by a surveyor of the Society. The surveyor is to be on board to the extent necessary to control the process.
Thickness measurement and close-up survey using RIT for liquefied gas carriers	UR Z7.2	1.4.2	Consideration may be given by the attending Surveyor to allow use of Remote Inspection Techniques (RIT) as an alternative to close-up survey. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor. When RIT is used for a close-up survey, temporary means of access for the corresponding thickness measurements as specified in this UR is to be provided unless such RIT is also able to carry out the required thickness measurements.
Close-up survey using RIT for liquefied gas carriers	UR Z7.2	1.5.3	When using a RIT as an alternative to close-up survey, if not carried out by the Society itself, it is to be conducted by a firm approved as a service supplier according to UR Z17 and is to be witnessed by an attending surveyor of the Society.
Examination and operational test of piping systems within certain spaces during special survey for liquefied gas carriers	UR Z7.2	2.2.1.3	All piping systems within the above spaces, except those covered by UR Z16, are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.
Thickness measurement for liquefied gas carriers	UR Z7.2	6.1.1	The required thickness measurements, if not carried out by the Society itself, are to be witnessed by a Surveyor of the Society. The Surveyor is to be on board to the extent necessary to control the process.
Examination and operational test of piping systems within certain tanks/spaces during special survey for oil tankers	UR Z10.1	2.2.1.3	Cargo piping on deck, including Crude Oil Washing (COW) piping, Cargo and Ballast piping within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor’s satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are open during repair periods and can be examined internally.

Intermediate survey for oil tankers 10-15 years of age	UR Z10.1	4.2.3.1	The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in 2 and 5.1. However, pressure testing of cargo and ballast tanks and the requirements for longitudinal strength evaluation of Hull Girder as required in 8.1.1.1 are not required unless deemed necessary by the attending Surveyor.
Intermediate survey for oil tankers over 15 years of age	UR Z10.1	4.2.4.1	The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in 2 and 5.1. However, pressure testing of cargo and ballast tanks and the requirements for longitudinal strength evaluation of Hull Girder as required in 8.1.1.1 are not required unless deemed necessary by the attending Surveyor.
Thickness measurement for oil tankers	UR Z10.1	7.1.1	The required thickness measurements, if not carried out by the Society itself, are to be witnessed by a Surveyor of the Society. The Surveyor is to be on board to the extent necessary to control the process.
Survey planning meeting	UR Z10.1	5.7.1	Proper preparation and close co-operation between the attending surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.
		5.7.2	Prior to commencement of any part of the renewal and intermediate survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement firm operator (as applicable) and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out. See also 7.1.2.
Examination and operational test of piping systems within certain spaces during special survey for bulk carriers	UR Z10.2	2.2.1.3	All piping systems within the above Spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.
Intermediate survey for bulk carriers 10-15 years of age	UR Z10.2	4.2.3.1	The requirements of the Intermediate Survey are to be to the same extent to the previous Special Survey as required in 2 and 5.1. However, internal examination of fuel tanks and pressure testing of all tanks are not

			required unless deemed necessary by the attending surveyor.
Intermediate survey for bulk carriers over 15 years of age	UR Z10.2	4.2.4.1	The requirements of the Intermediate Survey are to be to the same extent to the previous Special Survey as required in 2 and 5.1. However, internal examination of fuel tanks and pressure testing of all tanks are not required unless deemed necessary by the attending surveyor.
Survey planning meeting	UR Z10.2	5.7.1	Proper preparation and close co-operation between the attending surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.
		5.7.2	Prior to the commencement of any part of the Special and Intermediate Survey a survey planning meeting is to be held between the attending Surveyor(s), the Owner's Representative in attendance and the TM firm representative, where involved, and the master of the ship or an appropriately qualified representative appointed by the master or firm for the purpose of ascertaining that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out. See also 7.1.2.
Thickness measurement for bulk carriers	UR Z10.2	7.1.1	The required thickness measurements, if not carried out by the Society itself, are to be witnessed by a surveyor of the Society. The surveyor is to be on board to the extent necessary to control the process.
Thickness measurement and close-up survey using RIT for chemical tankers	UR Z10.3	1.4.2	Consideration may be given by the attending Surveyor to allow use of Remote Inspection Techniques (RIT) as an alternative to close-up survey. Surveys conducted using a RIT are to be completed to the satisfaction of the attending Surveyor.
Close-up survey using RIT for chemical tankers	UR Z10.3	1.5.3	When using a RIT as an alternative to close-up survey, if not carried out by the Society itself, it is to be conducted by a firm approved as a service supplier according to UR Z17 and is to be witnessed by an attending surveyor of the Society.
Examination and operational test of piping systems within certain	UR Z10.3	2.2.1.3	Cargo piping on deck and cargo and ballast piping within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor's

tanks/spaces during special survey for chemical tankers			satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are open during repair periods and can be examined internally.
Intermediate survey for chemical tankers 10-15 years of age	UR Z10.3	4.2.3.1	The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in 2 and 5.1. However, pressure testing of cargo and ballast tanks is not required unless deemed necessary by the attending Surveyor.
Intermediate survey for chemical tankers over 15 years of age	UR Z10.3	4.2.4.1	The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in 2 and 5.1. However, pressure testing of cargo and ballast tanks is not required unless deemed necessary by the attending Surveyor.
Survey planning meeting	UR Z10.3	5.7.1	Proper preparation and close co-operation between the attending surveyor(s) and the owner’s representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.
		5.7.2	Prior to the commencement of any part of the Special and Intermediate Survey a survey planning meeting is to be held between the attending Surveyor(s), the Owner’s Representative in attendance and the TM firm representative, where involved, and the master of the ship or an appropriately qualified representative appointed by the master or firm for the purpose of ascertaining that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out. See also 7.1.2.
Examination and operational test of piping systems within certain tanks/spaces during special survey for double hull oil tankers	UR Z10.4	2.2.1.3	Cargo piping on deck, including Crude Oil Washing (COW) piping, Cargo and Ballast piping within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor’s satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to any ballast piping in cargo tanks and any cargo piping in ballast tanks and void spaces, and Surveyors are to be advised on all occasions when this piping, including valves and fittings are open during repair periods and can be examined internally.

Intermediate survey for double hull oil tankers 10-15 years of age	UR Z10.4	4.2.3.1	The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in 2 and 5.1. However, pressure testing of cargo and ballast tanks and the requirements for longitudinal strength evaluation of Hull Girder as required in 8.1.1.1.are not required unless deemed necessary by the attending Surveyor.
Survey planning meeting	UR Z10.4	5.7.1	Proper preparation and close co-operation between the attending surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.
		5.7.2	Prior to the commencement of any part of the Special and Intermediate Survey a survey planning meeting is to be held between the attending Surveyor(s), the Owner's Representative in attendance, the TM firm representative, where involved, and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose of ascertaining that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out. See also 7.1.2.
Intermediate survey for double hull oil tankers over 15 years of age	UR Z10.4	4.2.4.1	The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in 2 and 5.1. However, pressure testing of cargo and ballast tanks and the requirements for longitudinal strength evaluation of Hull Girder as required in 8.1.1.1 are not required unless deemed necessary by the attending Surveyor.
Thickness measurement for double hull oil tankers	UR Z10.4	7.1.1	The required thickness measurements, if not carried out by the Society itself, are to be witnessed by a Surveyor of the Society. The Surveyor is to be on board to the extent necessary to control the process.
Examination and operational test of piping systems within certain spaces during special survey for double skin bulk carriers	UR Z10.5	2.2.1.3	All piping systems within the above spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

Selection of representative ballast tanks	UR Z10.5	Table IV	Overall survey of Representative ballast tanks selected by the attending surveyor (the selection is to include fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks) The requirements of the previous special survey (see 4.2.3) The requirements of the previous special survey (see 4.2.4)
Intermediate survey for double skin bulk carriers 10-15 years of age	UR Z10.5	4.2.3.1	The requirements of the Intermediate Survey are to the same extent as the previous Special Survey as required in 2 and 5.1. However, internal examination of fuel oil tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.
Intermediate survey for double skin bulk carriers over 15 years of age	UR Z10.5	4.2.4.1	The requirements of the Intermediate Survey are to be to the same extent as the previous Special Survey as required in 2 and 5.1. However, internal examination of fuel oil tanks and pressure testing of all tanks are not required unless deemed necessary by the attending Surveyor.
Thickness measurement for double skin bulk carriers	UR Z10.5	7.1.1	The required thickness measurements, if not carried out by the Classification Society itself, are to be witnessed by a Surveyor of the Society. The Surveyor is to be on board to the extent necessary to control the process.
Voyage repairs	UR Z13	ANNEX A.4.	Verification of new materials regarding certification, grade and scantlings. Verified mill sheets to remain on board and to be provided to attending Surveyor examining completed repairs.
		ANNEX A.6.	Verification of the qualification of welders and supervisory personnel, qualification records to remain on board and to be provided to attending Surveyor examining completed repairs.
		ANNEX A.12.	Completed repairs are to be examined and tested as required to the satisfaction of the attending Surveyor.
		ANNEX B.	Any contemplated repairs to primary hull structures, i.e. main longitudinal and transverse members and their attachments, are to be submitted to the Classification Society for review prior to commencing voyage repairs. Riding repairs to primary hull structures should not be permitted except in extreme circumstances. Any repairs to primary hull structures shall require attendance by a Surveyor riding-ship survey or at regular intervals to confirm fit-up, alignment, general workmanship and compliance with

			recommendations. NDT of completed repairs to primary structure to be carried out to attending Surveyor's satisfaction. Repairs to other hull structural parts may be accepted based on examination upon completion of repairs.
Close-up survey using RIT for mobile offshore drilling units	UR Z15	1.4.3	When using a RIT as an alternative to close-up survey, if not carried out by the Society itself, it is to be conducted by a firm approved as a service supplier according to UR Z17 and is to be witnessed by an attending surveyor of the Society.
Survey of the outside of unit's bottom and related items for mobile offshore drilling units	UR Z15	4.2.1. Surface-type Units (ship or barge type units)	• External surfaces of the hull, keel, stem, stern frame, rudder, nozzles, and sea strainers are to be selectively cleaned to the satisfaction of the attending Surveyor and examined together with appendages, the propeller, exposed parts of stern bearing assembly, rudder pintle and gudgeon securing arrangements, sea chest and strainers, and their fastenings. • Propeller shaft bearing, rudder bearing, and steering nozzle clearances are to be ascertained and recorded.
		4.2.2. Self-Elevating Units	• External surfaces of the upper hull or platform, spud cans, mat, underwater areas of legs, together with their connections as applicable, are to be selectively cleaned to the satisfaction of the attending Surveyor and examined. • At each Drydocking Survey or equivalent, after Special Survey No. 2, the Surveyor is to be satisfied with the condition of the internal structure of the mat or spud cans. Leg connections to mat and spud cans are to be examined at each Drydock Survey or equivalent. Non-destructive testing may be required of areas considered to be critical by the Society or found to be suspect by the Surveyor.
		4.2.3. Column-Stabilized Units	• External surfaces of the upper hull or platform, footings, pontoons or lower hulls, underwater areas of columns, bracing and their connections, sea chests, and propulsion units as applicable, are to be selectively cleaned and examined to the satisfaction of the attending Surveyor. Non-destructive testing may be required of areas considered to be critical by the Society or found to be suspect by the Surveyor.

Internal examination of boiler	UR Z18	2.1	... When direct visual internal inspection is not feasible due to the limited size of the internal spaces, such as for small boilers and/or narrow internal spaces, this may be replaced by a hydrostatic pressure test or by alternative verifications as determined by the Classification Society. …
Test of safety valves for exhaust gas heated economizer during annual survey	UR Z18	2.2	External survey of boilers including test of safety and protective devices, and test of safety valve using its relieving gear, is to be carried out annually, within the window of the Annual Survey of a ship. For exhaust gas heated economizers, the safety valves are to be tested by the Chief Engineer at sea within the annual survey window. This test is to be recorded in the log book for review by the attending Surveyor prior to crediting the Annual Survey of Machinery.
Machinery verification runs -Dock trial during special survey -Sea trial after significant repair	UR Z18	4.1	As part of the Special Survey of Machinery, a dock trial is to be carried out to attending Surveyors' satisfaction to confirm satisfactory operation of main and auxiliary machinery. If significant repairs are carried out to main or auxiliary machinery or steering gear, consideration should be given to a sea trial to attending Surveyors' satisfaction.
Tightness test during annual survey for shell and inner doors of Ro-Ro ships	UR Z24	4.12	A hose test or equivalent is to be carried out. If the visual examination and function test have shown satisfactory results, the tightness test of shell doors on Ro-Ro cargo ships need not be carried out unless considered necessary by the attending surveyor.
Close-up surveys of doors, locking, securing and supporting devices and fittings for Ro-Ro ships	UR Z24	Table 1	The following is a list of the devices and fittings and associated welding to be subject to close-up survey by the attending Surveyor.
